1.0 Introduction

This Remedial Action Workplan (RAWP) presents the protocols and procedures that will be implemented to remediate contaminated soil at the the East Barracks Rail Yard (Site), at East State Street and Olden Avenue, Trenton New Jersey (Figure 1). Remedial actions will be overseen by Wood Environment & Infrastructure Solutions, Inc. (Wood), on behalf of Amtrak (National Railroad Passenger Corporation). Remedial actions at the Site will be conducted pursuant to New Jersey Administrative Code (N.J.A.C.) 7:26C, *Administrative Requirements for Remediation of Contaminated Sites* (ARRCS) under oversight of a Licensed Site Remediation Professional (LSRP).

This RAWP provides information related to the New Jersey Department of Environmental Protection (NJDEP) Case Number 00-03-20-1219-43 under Program Interest (PI) Number G000043212. This RAWP has been prepared to address a historical discharge of polychlorinated biphenyls (PCBs), which was initially reported by the Site operator, New Jersey Transit (NJT), on March 20, 2000. The discharge was attributed to leaking transformers from electric powered, self-propelled rail cars. NJT entered into a Memorandum of Agreement (MOA) with the NJDEP on April 18, 2002. As the Site owner, Amtrak has continued the remedial activities to comply with the *Site Remediation Reform Act* (SRRRA), N.J.S.A. 58:10C-1 et seq. Amtrak has never operated the rail yard.

Initial remedial activities began in 2001 and were limited to areas within the Site boundaries. In addition to PCBs, volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals and pesticides were sporadically detected on the Site. Investigations subsequently indicated the need to expand the sampling activities to adjacent, offsite properties to complete delineation. These activities defined the limits of soil contamination, which extended onto two adjacent offsite properties, the P. J. Hill Elementary School (P.J. Hill) and the Hutchinson Industries property. The majority of the P.J. Hill Elementary School property was remediated in 2019¹. This RAWP presents the protocols and procedures that will be implemented to remediate contaminated soil on the Site including the adjacent offsite Hutchinson Industries property.

1.1 Purpose

This document summarizes the results of the remedial investigation (RI) at the Site and proposes remedial action (RA) to address contaminated soil associated with historical operations at the Site.

1.2 Compliance With Technical And Regulatory Requirements

The proposed RA is the excavation and offsite disposal of contaminated soil. All remedial activities performed for this project will be conducted in accordance with ARRCS, the *Technical Requirements for Site Remediation* (TRSR) - N.J.A.C. 7:26E, the current version of the NJDEP *Field Sampling Procedures Manual* (FSPM) (NJDEP, 2005), and applicable NJDEP technical guidance documents. There are no planned variances from the TRSR or applicable technical guidance documents associated with the proposed RA.

¹ A small portion of the school property is located on the rail yard side of the fence. This area will be addressed in this RAWP under AOC 2A.

1.2.1 Regulatory Status

The discharge of PCBs to soil that was reported to NJDEP is being addressed pursuant to the *Spill Compensation and Control Act* (Spill Act), N.J.S.A 58:10-23 and under the United States Environmental Protection Agency (USEPA) *Toxic Substances and Control Act* (TSCA), 15 U.S.C. §2601 et seq. Remediation of VOCs, SVOCs, metals and pesticides is governed by the Spill Act. Technical work has been, and will be, conducted in accordance with NJDEP's policy for coordination between NJDEP and USEPA relative to PCBs (NJDEP, 2020).

NJDEP regulations applicable to this project include:

- N.J.A.C. 7:1E *Discharges of Petroleum and Other Hazardous Materials Substances Rules*
- N.J.A.C. 7:26C ARRCs
- N.J.A.C. 7:26D *Remediation Standards*
- N.J.A.C. 7:26E TRSR

1.2.2 Cleanup Standards

1.2.2.1 NJDEP Site Remediation Program

All soil data collected for this RA will be compared to the NJDEP Residential Direct Contact Soil Remediation Standards (RDCSRS), the Non-Residential Direct Contact Soil Remediation Standards (NRDCSRS), and the 2013 default Impact to Ground Water Soil Screening Levels (IGWSSL), as applicable (NJDEP, 2010).

Note that per NJDEP policy, PCBs are considered an immobile chemical, as listed in the *Guidance for the Evaluation of Immobile Chemicals for the Impact to Ground Water Pathway* (NJDEP, 2008). Based on data generated during the RI, the IGW pathway for PCBs and the associated IGWSSL does not apply to the Site.

The RDCSRS will apply to the offsite Hutchinson property and the portion of the P.J. Hill property that is located on the Amtrak side of the boundary fence; the NRDCSRS applies to the onsite rail yard. The RDCSRS for PCBs is 0.2 milligrams per kilogram (mg/kg). The NRDCSRS is 1 mg/kg.

1.2.2.2 USEPA TSCA

NJDEP regulations provide that the federal PCB remediation policy must be coordinated with the NJDEP Site Remediation Program policy during PCB remediation projects. TSCA does not regulate PCBs at concentrations less than 1 mg/kg (aka ppm). For concentrations in soil greater than 1 mg/kg, TSCA stipulates a range of self-implementing cleanup levels based upon future high and low occupancy use scenarios, which are differentiated by the anticipated future exposure time frame for an individual not wearing dermal and respiratory protection for more or less than an average of 6.7 hours/week.

According to the TSCA Self-Implementing Cleanup Criteria for a High Occupancy Scenario, PCBs may remain between 1 mg/kg and less than or equal to 10 mg/kg with institutional and engineering controls. This would be applicable to residential, unrestricted use or other uses where occupancy will exceed an average of 6.7 hours/week. However, to also achieve NJDEP standards, the remedial goal for this project is to remove soil impacted with PCBs at concentrations greater

than 0.2 mg/kg (offsite areas to the NJDEP residential standard) or 1 mg/kg (onsite to the NJDEP non-residential standard). Note that NJDEP allows for capping of soil that is contaminated at concentrations greater than the applicable soil standard. However, Amtrak has chosen to remediate offsite soil to 0.2 mg/kg to allow unrestricted use offsite, and to remediate onsite soil to 1 mg/kg and forgo capping.

The self-implementing cleanup plan (SICP) for this Site was submitted to USEPA and approved on March 13, 2020. This RAWP incorporates elements of the approved SICP for PCB concentrations in soil greater than 1 mg/kg.

1.2.3 Regulatory Timeframe

The Site remediation process was required to be initiated on March 20, 2000. In accordance with SRRA, the regulatory timeframe for the remedial investigation report (RIR) was May 7, 2015. Remedial Timeframe Notification Forms were submitted to NJDEP in 2015 and 2016 to extend the regulatory deadline for the RIR to May 7, 2017. The Site-wide RIR was submitted by that date. However, access to offsite properties was not granted until 2018. The RIR for the offsite properties was completed in June 2019.

The remedial action regulatory timeframe for this Site is May 7, 2021. The RA for Area of Concern (AOC) 2A (P.J. Hill) was completed in 2019.

1.2.4 Technical and Regulatory Requirements

The following items were performed in accordance with current administrative regulatory requirements:

- The LSRP for this Site, Marlene Lindhardt, was retained on March 5, 2015.
- The initial Receptor Evaluation (RE) was submitted on April 1, 2016; an updated RE was included with the 2017 RIR and with the 2019 Supplemental RIR.
- Remediation Timeframe Notification Forms were submitted on April 2, 2015 and April 6, 2016. A Remediation Timeframe Notification Form was submitted on February 14, 2019 for the remedial action report, extending the date to May 7, 2021.
- The RIR was submitted on May 4, 2017.
- The Public Notification Form was submitted on February 14, 2019.
- The Supplemental RIR for AOCs 2A and 2B was submitted on June 12, 2019.
- The RAWP for AOC 2A – P. J. Hill Elementary School was submitted on July 1, 2019.
- The Remedial Action Report (RAR) for AOC 2A was submitted on May 22, 2020.

There are no outstanding NJDEP fees due as of December 2020.

On behalf of Amtrak, this RAWP is being submitted to NJDEP by the LSRP, Marlene Lindhardt, LSRP No. 581173 through the NJDEP online portal and includes the Case Inventory Document (CID).

2.0 Site Description and Physical Setting

Detailed information regarding the Site description and physical setting were discussed in the May 2017 and June 2019 RIRs.

2.1 Site Location and Topography

The East Barracks Site consists of land located on Block 25101 Lot 1, Block 25201 Lot 1, Block 25301 Lot 2, and Block 25401 Lot 4 in the city of Trenton. The entire Site encompasses approximately 7 acres and extends 0.47 miles in length. The general location of the Site is presented on Figure 1 (Site Location Map) and a site plan depicting the Site in greater detail is presented on Figure 2.

The Site is bordered by Olden Avenue to the north and Lincoln Avenue/Chambers Street to the south, which are elevated rail overpasses that cross the tracks. The Site is bordered to the west by the active Northeast Corridor rail line. Located adjacent to the eastern Site boundary is one school, a park, residential properties, and one industrial property, which front East State Street.

The Site is located approximately 1,000 feet south of Assunpink Creek, which discharges to the Delaware River approximately two miles west of the Site. Topography at the Site is generally flat, with the exception of rail lines that are slightly elevated. Relief across the Site is approximately two feet except along the southeastern portion of the Site, where soil that has been reworked and placed along the Site fence line results in a steep incline of up to four feet. The entrance to the Site (North Cook Avenue) is located down a moderately sloping hill. A slight depression is present parallel to the fence line along the western side of the railroad tracks. In addition, a slight depression or drainage swale is present to the southeast of the unpaved road that parallels the fence line that is located to the northeast of the North Cook Avenue entrance.

2.2 Geology

The Site is located in the northernmost section of the Atlantic Coastal Plain Province, approximately one mile south of the Fall Line (boundary of Piedmont Province). The Atlantic Coastal Plain is comprised of Cretaceous age unconsolidated or poorly consolidated layers of gravel, sand and clay.

According to the Geologic Map of the Trenton East and West Quadrangle, surficial deposits in the vicinity of the Site include artificial fill, fluvial deposits (Lake Wisconsin Glaciofluvial deposits), and alluvium. The Lake Wisconsin Glaciofluvial deposits, which are as much as 60 feet thick, consist of well stratified fine-to-coarse sand and unstratified to weakly stratified gravel. The alluvium deposits, which are as much as 40 feet thick, consist of unstratified to weakly stratified sand, silt, minor clay and peat and pebble to cobble gravel. The depth to bedrock beneath the Site is estimated to be greater than 40 feet.

2.3 Site Soil

Site historical operations have resulted in fill material being placed at the surface across the Site. Stone ballast is present adjacent to the current railroad tracks, along the unpaved road east of the fence that bisects the Site, and in the parking area. Underlying the ballast is fill material consisting

of black sand, cinders and gravel to a depth of approximately two feet. Below two feet are native deposits of sand, silt and gravel associated with the historical Assunpink Creek flood plain (Roux, 2002).

Wood advanced multiple shallow borings across the Site during the RI conducted between 2015 and 2017. The soils encountered were consistent with those reported by Roux Associates, Inc. (Roux) in the 2002 Remedial Investigation Work Plan (RIWP).

2.4 Hydrogeology

According to Roux, based on groundwater investigations conducted at the adjacent NJT former Mercer Bus Garage facility² that was located immediately to the northeast of the Site, groundwater in the area occurs under unconfined, water table conditions. The depth to water at the adjacent former Mercer Bus Garage facility was encountered at 18 to 19.5 feet below ground surface (bgs). The direction of groundwater flow at the former Mercer Bus Garage was determined to be to the north, towards Assunpink Creek. Therefore, it was assumed that groundwater at the Site also flows to the north (Roux, 2003).

Based on Site-specific data, the depth to groundwater at the Site is approximately 5.3 to 7.8 feet bgs at the rail yard.

2.5 Surrounding Land Use

The property is located within the city of Trenton, in a commercial area with high density residential, mixed urban, and industrial land use to the east, with deciduous forest sections to the west of the Northeast Corridor rail tracks. The Site is bordered on the north by Olden Avenue, south by Lincoln Avenue/Chambers Street, and west by the Northeast Corridor. The entrance to the Site is at North Cook Avenue. Located adjacent to the eastern Site boundary is P.J. Hill Elementary School, Greg Grant Park, numerous residential properties, and an industrial property (Hutchinson) along East State Street. Refuse and debris have been observed outside the Site boundary at the rear of these East State Street properties, adjacent to the Site.

Both the P.J. Hill Elementary school and the Hutchinson property have been the subject of previous environmental investigations and remedial activities.

2.6 Areas of Concern

Three areas of concern have been identified for this Site, as shown on Figure 2.

- AOC-1 Historical PCB Discharge encompasses the entire onsite property.
- AOC-2A Offsite Property includes the P. J. Hill Elementary School. AOC-2A is the subject of the 2020 RAR and has been remediated to RDCSRS.
- AOC-2B Offsite Property includes the Hutchinson Industries property.

² This property is currently the location of the Hutchinson Corporation facility that has been designated AOC 2B.

2.6.1 AOC-1 Onsite History and Operations

Amtrak acquired the East Barracks rail yard on April 1, 1976 when Amtrak was created and took over the entire Northeast Corridor line through an act of Congress. Amtrak has never operated the rail yard. NJT and predecessor railroads, including the Pennsylvania Railroad and the Penn Central Transportation Company, used the rail yard for overnight storage of electric-powered, self-propelled passenger rail equipment for the Northeast Corridor rail line. The facility provided minor routine maintenance, e.g., brake pad changing, interior car cleaning, and overnight storage for commuter rail cars. NJT presently maintains the lease on the property from Amtrak but has not operated the rail yard for several years.

The Site is currently used by Amtrak for storage of rail equipment that is used to maintain the railroad right of way. The Site consists of the following:

- Active and former rail lines/spurs,
- One crew office trailer, and
- A parking area.

The Site is bordered by the active Northeast Corridor rail line to the west. See Figure 2.

2.6.2 AOC 2A and AOC 2B Offsite Properties History and Operations

Wood conducted Open Public Record Act (OPRA) reviews of the two properties adjacent to northeast side of the East Barracks railyard where PCBs had not been delineated to the Amtrak property line.

2.6.2.1 P.J. Hill Elementary School (AOC 2A)

The PJ Hill Elementary School, located at 1010 East State Street, Block 25301 Lot 1, was the subject of an environmental investigation in 1995 for the removal of a No. 2 fuel oil, 10,000-gallon underground storage tank (UST) under closure number C95-0710 and PI No. 026772.

The property is bordered by East State Street to the east, North Cook Avenue to the south, AOC 2B (described below) to the north and the East Barracks rail yard to the west. It is relatively flat with a slight grade towards the rail yard. Most of the property is covered by the school buildings constructed in the 1970's and paved parking areas. The portion of the property immediately adjacent to the rail yard is a paved parking lot.

PCB-contaminated soil in AOC 2A was excavated in 2019. This AOC was remediated to meet RDCSRS as described in the RAR (Wood, 2020b).

2.6.2.2 Hutchinson Industries Inc. (AOC 2B)

This property, located at 1132 East State Street, Trenton Block 25401, Lots 1 and 2, is currently owned by L&F Urban Renewal Properties. The property was previously owned by NJT and was used as a bus garage. The NJDEP has identified this site on the Known Contaminated Sites List (KCSL) as New Jersey Transit Former Mercer Bus Garage, PI No. 011737. The property has been the subject of multiple previous investigations as discussed in Section 3.0.

The property is currently leased by Hutchinson Industries, Inc. which supplies mobility components for wheeled vehicles under Department of Defense contracts.

The property is bordered by East State Street to the east, P.J. JHill Elementary School to the south, North Olden Avenue to the north and the East Barracks rail yard to the west. It is relatively flat with a slight grade towards the rail yard. Lot 1 consists of buildings and paved areas. The portion of Lot 1 that is immediately adjacent to the rail yard is covered by a building and parking area bordered by a fence.

Most of Lot 2 is a grassy area including the site cap required by a remedial action permit (RAP) for soil. The portion of Lot 2 that is immediately adjacent to the rail yard is grass and bordered by a fence.

Between the fence and the Amtrak property line, the area consists of heavy brush with quantities of debris and trash.

3.0 Previous Investigations

3.1 Initial Investigation - 1999

NJT collected four soil samples from the track area in November 1999 to investigate the presence of PCBs. PCBs were detected at concentrations ranging between 519 mg/kg and 36,205 mg/kg, exceeding the NJDEP Non-Residential Direct Contact Soil Clean Criteria (NRDCSCC) of 2 mg/kg which was in effect at the time (Roux, 2003).

On December 29, 1999, NJT issued an internal memorandum as a precautionary measure to notify employees that PCBs had been detected under the ballast at the Site during routine environmental testing. The memorandum prohibited excavation without prior NJT approval, and also stated that additional ballast and liner fabric was being placed at the Site (NJT, 1999).

On March 20, 2000, NJT notified the NJDEP communications center of these findings, and Case Number 00-03-20-1219-43 was assigned. No specific details regarding the testing results or interim remedial actions are available for review.

In order to prevent direct contact by workers with the PCB-impacted soil/ballast and to minimize the potential for migration of PCB contamination, NJT installed a geotextile liner over the existing ballast between and within the railroad tracks, and placed an additional one foot of clean ballast on top of the geotextile liner. NJT entered into a MOA with NJDEP on April 18, 2002 (Roux, 2003). No documentation or maps depicting the sample locations are available for review.

(It should be noted that the analytical results from the NJT 1999 sampling event have not been replicated in subsequent investigations; further an analytical laboratory report for these historical samples is not available for review.)

3.2 Remedial Investigation – 2001

On behalf of NJT, Roux conducted soil sampling activities at the Site on October 18, 2001. The results of the October 2001 sampling activities were presented in a Roux 2002 RIWP and are summarized below.

Eight soil borings were completed to a depth of 2.5 feet bgs. Two soil samples were collected from each boring, one from the zero to 0.5-foot interval of the first soil encountered below the geotextile liner and the second from 2.0 to 2.5 bgs. A total of 16 soil samples were analyzed for PCBs. PCB concentrations ranged from 3.8 mg/kg to 440 mg/kg in the zero to 0.5-foot samples, and from 0.077 mg/kg to 160 mg/kg in the 2.0 to 2.5-foot samples. The soil sample from the zero to 0.5-foot interval from the track area exhibiting the highest PCB concentration and the soil sample from the zero to 0.5-foot interval from the swale area exhibiting the highest PCB concentration were also analyzed for the priority pollutant list parameters with a library search (PP+40). Additional compounds exceeding the NJDEP NRDCSCC were detected and included: base neutral extractable compounds (BNs), specifically polynuclear aromatic hydrocarbons (PAHs); arsenic; and pesticides (specifically dieldrin, endrin, 1,1-dichloro-2,2-bis(p-chlorophenyl) ethylene (4',4'-DDE), and dichloro-diphenyl-trichloroethane (4',4'-DDT) (Roux, 2002).

The 2001 sampling activities were documented in the Roux 2002 RIWP that was submitted to NJDEP on March 6, 2002. The RIWP proposed additional sampling to achieve delineation of contaminants at the Site.

3.3 Remedial Investigation - 2003

Roux conducted two sampling events in May 2002 and May 2003³. All soil samples were analyzed for PCBs and select soil samples were analyzed for PP+40. The May 2002 sampling event included soil borings completed within the track area (the northern portion of the Site between the catenary poles and fence) and in the parking area near the entrance to the Site. The second sampling event completed in May 2003 entailed additional delineation sampling south of the track area, within the employee parking area and to the south of the fence along the unpaved road that parallels the railroad tracks.

During the two sampling events, a total of 62 soil borings were completed and 108 soil samples were collected for laboratory analysis. Soil samples were collected from the surface soil at all boring locations, with the exception of a row of samples collected between the existing railroad tracks, where soil contaminants were assumed to be less than the soil cleanup criteria (SCC). Deeper soil samples were also collected within the track area of the property and the parking lot.

Overall, the sampling results from the zero to 0.5-foot interval below the geotextile liner within and immediately adjacent to the track area confirmed that the PCB concentrations were greater than the NRDCSCC. PCB concentrations at the surface along the fence line also exceeded the NRDCSCC. However, half of the results for surface soil samples from the parking lot were less than the NRDCSCC and the remainder were only slightly greater than the NRDCSCC. With a few exceptions, the soil samples that were collected from the 2.0 to 2.5-foot interval below the geotextile liner within and immediately adjacent to the track area exhibited PCB concentrations that were less than the NRDCSCC. No concentrations of constituents greater than the NRDCSCC were detected in soil samples analyzed for PP+40.

The findings of the RIR included:

- Surface soil at the north, east and west perimeter of the Site exceeded the NRDCSCC for PCBs. This area was beyond the NJT-specified Site perimeter and immediately adjacent to the active railroad tracks of Amtrak's Northeast Corridor. Therefore, no further delineation or remediation was conducted.
- The upper two feet of soil and ballast within the track area located between the fence line and the catenary poles, where the PCB concentrations in soil exceeded the NRDCSCC was recommended for excavation and offsite disposal.
- Concentrations of other constituents that exceeded the NRDCSCC, which were identified through the PP+40 analyses, were limited to the surface soil in the zero to 0.5-foot interval.

³ The information in this section was taken from the draft 2003 Roux RIR (the final document was not available for review.) Note that the NJDEP Data Miner website lists receipt of a site investigation report on February 17, 2004. It is not known if the referenced report is the final version of the draft RIR that was available for Wood review. The referenced report was not located through the OPRA records search of NJDEP files

Surface soil concentrations of PP+40 constituents that exceeded the NRDCSCC would be included in the excavation of the PCB-impacted surface soil.

- Generally, the concentrations of PCBs that exceeded the NRDCSCC were limited to the gray to black fill material beneath and adjacent to the railroad tracks. The gray to black fill material was typically limited to a depth of two feet bgs. For the most part, the yellowish-brown sand present below the fill material did not contain contaminants that exceeded the NRDCSCC.
- The extent of soil with PCB concentrations that exceeded the TSCA concentration of 50 mg/kg was generally defined. The extent of TSCA-regulated soils would be further defined during implementation of the remedial action.
- Full delineation to the Residential Direct Contact Soil Cleanup Criteria (RDCSCC) and NRDCSCC was not completed along the southern portion of the Site. Therefore, surface soil concentrations of PCBs present to the south of the fence, which parallels the railroad tracks, would be further defined via additional delineation prior to submission of a RAWP.

The draft RIR included specific recommendations for additional delineation sampling; it is not known whether this additional investigation was performed, and no supplemental data were available for Wood review. Based on the 2015 OPRA reviews of NJDEP documents, an RAWP was not located.

3.4 Remedial Investigation – 2017

As reported in the 2017 RIR, additional onsite investigation was conducted by Amec Foster Wheeler Environment & Infrastructure, In. (Amec Foster Wheeler – now Wood) on behalf of Amtrak between 2015 and 2017 to complete delineation of PCBs, VOCs and pesticides in soil.

3.4.1 Polychlorinated Biphenyls

Wood reviewed the historical sample results for PCB analysis, which were collected from 65 locations across the Site during the initial investigations performed by Roux between 2001 and 2003. Samples were then collected from an additional 72 onsite locations for delineation purposes as part of this RI.

Complete results for the entire Site are included in the 2017 RIR. Historical analytical data for PCBs that were provided in the Roux reports were incorporated into the RIR and are discussed below.

3.4.1.1 Northern Area (Phase 1)

PCB results for the northern portion of the area to be excavated ranged from not detected to 506 mg/kg at location E-50 (0.5 to 1.0-foot interval). Horizontal delineation to the northern Site boundary could not be completed past onsite location E-43 due to placement of permanent rail equipment and associated safety issues. Horizontal delineation is precluded to the west by the Northeast Corridor.

Delineation to the east is complete; PCB concentrations greater than the RDCSRS of 0.2 mg/kg extended onto the adjacent Hutchinson property. This area is designated as AOC 2B and will be remediated concurrently with the onsite northern area.

PCB concentrations also exceeded the RDCSRS under the paved parking lot of the P.J. Hill Elementary School. None of the results were greater than 1 mg/kg and the area was not subject to TSCA. Amtrak conducted excavation of the school parking lot in 2019 and remediation to RDCSRS was completed. A small portion of land included in the school parcel is actually located within the Amtrak fenced property. This area, designated AOC 2A, will be remediated concurrently with the onsite northern area.

Within the northern area, the majority of PCB exceedances occurs in the upper two feet of soil beneath the ballast, to a maximum depth of 4 feet bgs. Vertical delineation is complete.

3.4.1.2 Southern Area (Phase 2)

PCB results in the southern portion of the area to be excavated ranged from not detected to 136 mg/kg at E-61 (0.5 to 1.0-foot interval). Delineation to 1 mg/kg was not complete at the southern Site boundary along the eastern fence line, where PCB concentrations at location E-61 were 84.6 mg/kg (sample E 61-2.0-2.5) and 136 mg/kg (sample E-61-0.5-1.0). This location was later delineated in 2020. It is within the area to be excavated; post-excavation sampling will be conducted to confirm that remediation to 1 mg/kg is complete. Horizontal delineation to the west is precluded by the Northeast Corridor line. With the exception of location E-72, PCBs have been delineated to 0.2 mg/kg at the eastern Site boundary. Post-excavation sampling will be conducted to confirm that excavation achieves the remedial goals.

Within the southern area, the majority of PCB exceedances occurs in the upper two feet of soil, beneath the ballast to a maximum depth of 2.5 feet bgs.

3.4.2 Volatile Organic Compounds

During the course of the initial investigations, Roux collected 21 samples for VOC analysis. Results indicated IGWSSL exceedances of methylene chloride, a common laboratory contaminant, and one IGWSSL exceedance for benzene at SB-1. However, the majority of the laboratory detection limits for the samples were greater than current standards. In order to confirm the VOC results, Wood collected an initial round of samples from ten locations for Target Compound List (TCL) VOC plus library search for 15 Tentatively Identified Compounds (TICs) (+15) analysis. The results indicated an exceedance of the IGWSSL for tetrachloroethene (PCE) at two locations, E-1 (0.028 mg/kg) and E-2 (0.009 mg/kg). A second sampling event was conducted to delineate these locations. Samples to horizontally delineate E-1 were collected from E-30 and E-31. PCE was not detected in either sample. Delineation to the west was precluded for safety reasons by the proximity of the Northeast Corridor. The PCE was limited to the upper four feet of soil. Samples to delineate E-1 and E-2 were collected from E-30/E-31 and E 32/E-33, respectively. VOCs were not detected. These locations provide horizontal and vertical delineation to 5 feet bgs.⁴

⁴ All detections of VOCs that exceeded applicable standards are located in the area directly adjacent to the active Northeast Corridor rail line and are not included in the areas addressed by this RAWP. Locations directly adjacent to the active rail line will be addressed in the future when work can be conducted safely.

3.4.3 Semi-Volatile Organic Compounds

All samples that were analyzed for SVOCs were collected by Roux during the 2001 to 2003 investigations.

SVOCs that exceeded current standards were reported for 7 of 18 soil boring locations: A-15(1.0-1.5); D-4(0.0-0.5); PL-12(0.0-0.5); D-13(0.0-0.5); PL-1(0.0-0.5); SB-1; and SB-6.

SVOC parameters that exceeded current standards were 1,2,4 trichlorobenzene and the PAHs: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene (estimated values only), and indeno(1,2,3-c,d)pyrene.

3.4.4 Metals

All samples that were analyzed for target analyte list (TAL) metals were collected by Roux during the 2001 to 2003 investigations.

Metal concentrations that exceeded current IGWSSL were reported for 6 of 16 soil boring locations: A-15(1.0-1.5); C-10(2.0-2.5); D4(0.0-0.5); D-13(0-0.5); PL-1(0.0-0.5); and PL 12(0.0-0.5). The parameters that exceeded IGWSSL include antimony, beryllium, lead (an Immobile Chemical) and mercury. None of the results exceeded NRDCSRS or RDCSRS.

3.4.5 Pesticides

Historical pesticide results reported by Roux indicated that contamination was limited to the upper two feet of soil and located in sporadic locations across the Site. Pesticides that historically exceeded standards included dieldrin, endrin, 4,4'DDE, and 4,4'DDT (the latter two chemicals are classified as Immobile Chemicals).

Samples for analysis were collected from ten locations by Wood to delineate the historical pesticides reported by Roux and to verify results where laboratory detection limits from the historical investigations were greater than current applicable standards. Based on the results of the first event, two additional samples were collected in order to confirm horizontal delineation of dieldrin.

3.5 Previous Investigations at Offsite Areas

3.5.1 P.J. Hill Elementary School (AOC 2A)

The PJ Hill Elementary School was the subject of an environmental investigation in 1995 for the removal of a No. 2 fuel oil, 10,000-gallon UST. The UST was removed and sent offsite for disposal. No holes or signs of deterioration were observed in the tank. No groundwater was encountered in the excavation. No evidence of contamination was observed in the excavation or overburden soils. Post-excavation soil samples were analyzed for total petroleum hydrocarbons; none of the results exceeded standards in effect at the time. The backfill was supplied by Haas Sand & Gravel, Inc from a virgin quarry in Tabernacle, New Jersey (Schoor DePalma, 1995). The site received a No Further Action (NFA) determination letter from NJDEP, dated April 26, 1996.

On April 1, 2002, NJDEP issued a letter with subject Non-Compliant Regulated UST Systems that listed two 10,000-gallon No. 2 fuel oil USTs, which were stated to be in service. Based on

correspondence from Schoor DePalma, only one UST had been present at the Site and it was removed in 1995 (as noted above). Based on the current NJDEP DataMiner UST Registration Summary for P.J. Hill School, PI 026772, the 10,000-gallon UST that was present on the site was removed in 1995.

3.5.2 Hutchinson Industries, Inc. (AOC 2B)

Hutchinson Industries, Inc. is the current tenant of the property located at 1132 East State Street, Trenton B25401 lots 1 and 2. It is the location of a known contaminated site, the Former NJT Mercer Bus Garage, currently owned by L&F Urban Renewal Properties.

Based on various documents obtained during the OPRA review, as the Former Mercer Bus Garage site, this property has a long history of spills, environmental investigations and remediation beginning in 1983. At that time, the property was owned by the Mercer County Improvement Authority. NJT owned the property from November 27, 1984 to May 19, 2005.

In 1996, five USTs were removed from the site. Visually impacted soil was excavated. Several soil sample results exceeded the standard for VOCs at the time; one sample was analyzed for PCBs, which were not detected (Dames and Moore, 1996).

Several investigations were subsequently conducted for soil and groundwater. Free product was observed on the water table. A soil and groundwater investigation was conducted as reported by Dames and Moore in 1998. Soil-vapor extraction and light non-aqueous phase liquid (LNAPL) recovery were implemented in 2000 as discussed in the Dames and Moore *Remedial Investigation/ Remedial Action Workplan*, dated August 4, 1999, and the URS *Progress Remedial Action Progress Report, September – December 2000*, dated July 27, 2001. A classification exception area (CEA) was established on August 1, 2001. The systems were operated for several years; however, the LNAPL was not completely remediated.

NJT transferred the property to the City of Trenton, who owned it from May 19, 2005 to November 25, 2008. The city apparently assumed responsibility for the site remediation. The LNAPL recovery system was shut down and additional soil excavation was performed in 2008. PCBs were not detected in the imported backfill. Groundwater investigations continued. In 2008, a 1,000-gallon heating oil UST was encountered during construction activities, and was subsequently removed (USA Environmental Management Inc., 2008). NJDEP issued an unrestricted NFA determination for this UST on February 23, 2009. No analysis for PCBs was reported.

L&F Urban Renewal Properties has owned the property since November 25, 2008. A deed notice dated October 16, 2016 was filed for PAHs and lead. Vegetative cover and concrete caps the deed notice area.

An RAR dated February 3, 2017 details the site history and recommends no further action for soil, with the deed notice and vegetative cap to remain. It also recommends no further action for groundwater and the lifting of the CEA (Sadat, 2017). An RAP for the soil was issued on October 6, 2017 and the site is subject to biennial certifications. A response action outcome (RAO) for restricted use was issued on January 12, 2018. The NJDEP removed the CEA on February 12, 2018.

3.5.3 Offsite Remedial Investigation – 2019

As previously stated, due to access issues, offsite RI activities could not be conducted concurrently with the onsite RI for the East Barracks Rail Yard. Wood conducted RI activities at AOC 2A and 2B as reported in the *Supplemental Remedial Investigation Report – Offsite Properties (AOC 2A and AOC 2B)*, dated June 3, 2019 and summarized below.

3.5.3.1 AOC-2A Offsite Property (PJ Hill Elementary School)

Soil samples for PCB analysis were collected from a total of 12 locations. These include three locations, PL-9 in 2002, E-5 in 2015 and E-36 in 2016, which are located outside the fence of the P.J. Hill Elementary School and were originally believed to be on Amtrak property⁵.

Analytical results for samples within the fenced property ranged from not detected to 0.772 mg/kg. (zero to 0.5-foot interval). PCBs were not detected in the 2.0 to 2.5-foot interval except for E-75-1 (0.246 mg/kg). This location was vertically delineated at 7.5-8.0 feet bgs.

Horizontal delineation was provided for each location by a step-out sample approximately 5 feet to the east of the original sample.

All locations where PCB results exceeded the RDCSRS of 0.2 mg/kg were located within 10 feet of the fence line. Locations PL-9 (0.0-0.5: 11 mg/kg and 2.0-2.5: 0.25 mg/kg), E-5 (0/5-1.0: 6.35 mg/kg, 2.0-2.5: 0.247 mg/kg, and 3.0-3.5: 0.103 mg/kg), and E-36 (0.5-1.0: Not Detected and 2.0-2.5: Not Detected) are located on the Amtrak side of the fence and not accessible to the public.

PCBs in soil were horizontally and vertically delineated on the offsite property to a maximum depth of 2.5 feet below the asphalt paving. PCBs at concentrations greater than the RDCSRS were present below the asphalt along the property fence line extending up to 10 feet into the school parking lot.

None of the results on the school side of the fence exceeded the NRDCSRS/TSCA limit of 1 mg/kg.

3.5.3.2 AOC-2B Offsite Property (Hutchinson Industries)

Samples in AOC 2B were collected from two Blocks/Lots. Locations E-76-1, E-76-2, and E-76-3 were located in Block 25401, Lot 2. PCB results for E-76-1 were 5.28 mg/kg from 0.5-1.0 feet bgs and 0.744 mg/kg at 3.0-3.5 feet bgs. Vertical delineation is provided by E-76-2 at 4.0-4.5 feet, where PCBs were not detected. PCBs were also not detected at E-76-3 from 0.5-1.0 feet bgs and 3.0-3.5 feet bgs, which completes delineation in this area.

On Block 1, samples were collected from 16 locations on the Amtrak side of the fence line along on the back side of a Hutchinson building. Sample results ranged from not detected to 2.07 mg/kg in E-77-2. The area around E-77 was vertically delineated by E-77-3 where PCBs were not detected from 5.5-5.0 feet bgs. Results for most of the samples that were collected behind the building indicated vertical delineation at 2.5 feet bgs.

PCBs in soil have been horizontally and vertically delineated on the property to a maximum depth of 4.0 feet in Lot 2 and 5.0 feet in Lot 1. PCBs at concentrations greater than the Soil Remediation

⁵ These locations are located outside the school fence and inside the Amtrak fenced property and will be included in AOC 1 onsite remedial actions.

Standards (SRS) are present along the property fence line extending up to 10 feet into the property.

Sample locations E-77 through E87 are located outside the Hutchinson Industries property fence line in an area of heavy brush and some debris. PCBs at concentrations greater than RDCSRS are present in surficial samples, generally between 0.5-1.0 feet bgs. At one location, PCBs are present at 4.5 feet bgs. The area is not accessible from the Hutchinson side of the fence. Access to the Amtrak side of the property is strictly restricted and not open to the public. Further, the area is not located in an area where any Amtrak operations personnel would have reason to enter. Therefore, there is minimal risk of exposure to PCBs in this AOC. This area is included in the remedial actions proposed in this RAWP.

3.5.4 P.J. Hill Elementary School AOC 2A Remedial Action - 2019

Amtrak conducted RA activities at AOC 2A in 2019. The RA consisted of excavation of soil in the area where PCBs were present at concentrations greater than the RDCSRS. The objective of the excavation was to remove PCBs to levels that allow unrestricted use of the property.

The scope of work for the RA included the excavation, loading into roll-off containers, transportation and offsite disposal of approximately 500 tons of soil, backfilling with clean fill approved by the LSRP, and restoration of blacktop and fencing to pre-existing conditions.

As described in the *Remedial Action Report – AOC 2A Patton J. Hill Elementary School*, dated May 20, 2020, the excavated area was covered by asphalt pavement. The asphalt was removed, an area that ran the length of the school and rail yard property line and was approximately 10 feet wide was excavated to a depth of up to 4 feet below ground surface. A total of 501 tons was removed for offsite disposal. Post-excavation samples were collected at the frequency required by the RAWP and results compared to the RDCSRS of 2 mg/kg. Once it was verified that the remaining soil met the RDCSRS, the area was restored with clean backfill, repaved and a new fence installed along the property line (Wood, 2020b).

Based on the property line survey, a small portion of the P.J. Hill Elementary School property is located on the Amtrak side of the fence. This area was not remediated in 2019 and will be addressed in this RAWP and RA.

4.0 Pre-Remediation Investigation

In 2020, Wood conducted additional investigation activities in AOC-1, AOC-2A and AOC-2B. The scope of the investigation was based on a detailed review of all sample results to date. Additional sample locations were designed to further refine the areas that require remediation.

A total of 252 samples was collected from 110 locations. The samples collected for the 2020 investigation were analyzed for PCBs and are listed in Table 1; analytical results are shown in Table 3 and on Figures 3 and 4. Samples were collected from the onsite rail yard area (AOC-1), the small portion of the P. J. Hill property (AOC 2A) that is on the Amtrak side of the boundary fence, and the offsite Hutchinson property (AOC-2B).

The results of the 2020 investigation are included in the comprehensive discussion of investigation results in Section 5.0 that presents all available data and provide the basis for the proposed RA.

4.1 Pre-Existing Data Evaluation

Wood reviewed the onsite and offsite data collected during the previous investigations for the Site. Based on this review, Additional sample locations were selected to refine the horizontal and vertical limits of contamination.

4.2 Quality Assurance/Quality Control

All field work was completed in accordance with the Quality Assurance Project Plan (QAPP) contained in Appendix B, as well as the TRSR, the FSPM, and applicable NJDEP guidance. All samples were analyzed by Alpha Analytical, NJDEP Certification MA935, located in Westborough, Massachusetts. The analytical method employed was USEPA SW846 8082A for PCBs.

4.2.1 Field Quality Control Samples

Duplicate samples and equipment blanks were collected at the frequency specified in the QAPP. The results for the equipment blanks are included in Table 2. A low level of Aroclor 1248 was detected in one sample. No PCBs were detected in any other equipment blanks for the duration of the sampling program.

Duplicate sample results are discussed under the specific AOC results section and included in Table 3. Duplicate samples were collected at:

E-108-3.0-3.5	E-167-0.5-1.0
E-110-0.5-1.0	E-171-0.5-1.0
E-126-0.5-1.0	E-175-0.5-1.0
E-127-0.5-1.0	E-176-2.0-2.5
E-136-0.5-1.0	E-193-0.5-1.0
E-142-2.0-2.5	E-198-0.5-1.0
E-164-0.5-1.0	

All duplicate results provided data that were consistent with the original samples.

4.2.2 Data Usability

Samples were reported in 16 delivery group (SDG) packages.

L2005778	L2007688
L2005946	L2007690
L2006151	L2007956
L2006460	L2008134
L2006705	L2008381
L2006870	L2008618
L2007286	L2008619
L2007485	L2008805

Wood reviewed all laboratory analytical data deliverables for completeness and general conformance with analytical requirements. The data reviewed are considered to be valid and useful for the intended purposes. All method specified calibrations and quality control performance criteria were met for these data, except as noted in the conformance/non-conformance summaries provided in the laboratory deliverable packages and below.

The laboratory data are reliable based upon compliance with sample holding times and precision and accuracy criteria for each analytical method, as well as the results of the analyses of blanks, within the limitations noted in the laboratory reports. For several samples, the laboratory reporting limit was greater than the SRS; however, the data were considered usable.

There were no significant events or seasonal variations that are known to have affected the sampling procedures or the results for the soil samples presented in this report. QC results for each SDG are discussed below.

4.2.2.1 SDG L2005778

L2005778-16, -17, and -21: The surrogate recoveries were below the acceptance criteria for 2,4,5,6-tetrachloro-m-xylene (0%) and decachlorobiphenyl (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis were reported.

4.2.2.2 SDG L2005946

L2005946-11, -13, -14, and -15: The surrogate recoveries were below the acceptance criteria for 2,4,5,6-tetrachloro-m-xylene (0%) and decachlorobiphenyl (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis were reported.

4.2.2.3 SDG L2006151

L2006151-14: The collection date and time on the chain of custody was 11-FEB-20 13:46; however, the collection date and time on the container label was 11-FEB-20 13:49. The collection date and time was reported as 11-FEB-20 13:46.

L2006151-16: The sample identified as "X-4_02112020" on the chain of custody was identified as "X-3_02112020" on the container label. The sample was reported as "X-4_02112020."

4.2.2.4 SDG L2006460

WG1340879: A matrix spike (MS) was not analyzed because the dilution required by the elevated concentrations of nontarget compounds present in the native sample would have caused the spike compounds to be diluted below the range of calibration.

L2006460-01, -15, and WG1340879-5: The surrogate recoveries were below the acceptance criteria for 2,4,5,6-tetrachloro-m-xylene (0%) and decachlorobiphenyl (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis were reported.

4.2.2.5 SDG L2006705

L2006705-11: The sample identified as "E-129-2.0-2.5" on the chain of custody was identified as "E-128-2.0-2.5" on the container label. At Wood's request, the sample was reported as "E-129-2.0-2.5."

L2006705-05, -07, -12, -16, -17, -18, and -23: The surrogate recoveries were below the acceptance criteria for 2,4,5,6-tetrachloro-m-xylene (0%) and decachlorobiphenyl (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis were reported.

4.2.2.6 SDG L2006870

L2006870-04 and -05: The surrogate recoveries were below the acceptance criteria for 2,4,5,6-tetrachloro-m-xylene (0%) and decachlorobiphenyl (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis were reported.

4.2.2.7 SDG L2007286

L2007286-01, -02, -03, -04, -05, -07, -08, -10, -11, and -28: The surrogate recoveries were below the acceptance criteria for 2,4,5,6-tetrachloro-m-xylene (0%) and decachlorobiphenyl (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis were reported.

4.2.2.8 SDG L2007485

L2007485-06 and -07: The surrogate recoveries were below the acceptance criteria for 2,4,5,6-tetrachloro-m-xylene (0%) and decachlorobiphenyl (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis were reported.

4.2.2.9 SDG L2007688

L2007688-04: The surrogate recoveries were below the acceptance criteria for 2,4,5,6-tetrachloro-m-xylene (0%) and decachlorobiphenyl (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis were reported.

4.2.2.10 SDG L2007690

The WG1343647-4 MS recovery performed on L2007690-01 was below the acceptance criteria for Aroclor 1260 (0%) due to the concentration of this compound falling below the reported detection limit.

4.2.2.11 SDG L2007956

L2007956-14, -15, -16, and -17: The surrogate recoveries were below the acceptance criteria for 2,4,5,6-tetrachloro-m-xylene (0%) and decachlorobiphenyl (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis were reported.

4.2.2.12 SDG L2008134

L2008134-02: The reporting limit was 0.205 mg/kg, which was reported as greater than the target regulatory standard of 0.2 mg/kg. Because the total PCB result was 1.07 mg/kg, the result exceeds the standard and is considered usable.

4.2.2.13 SDG L2008381

L2008381-01, -13 and WG1344816-5: The surrogate recoveries were below the acceptance criteria for 2,4,5,6-tetrachloro-m-xylene (0%) and decachlorobiphenyl (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis were reported.

4.2.2.14 SDG L2008618

L2008618-01, -02, and -03: The surrogate recoveries were below the acceptance criteria for 2,4,5,6-tetrachloro-m-xylene (0%) and decachlorobiphenyl (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis were reported.

4.2.2.15 SDG L2008619

L2008619-07 and -08: The surrogate recoveries were below the acceptance criteria for 2,4,5,6-tetrachloro-m-xylene (0%) and decachlorobiphenyl (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis were reported.

4.2.2.16 SDG L2008805

L2008805-09, -11, -12, and -19: The surrogate recoveries were below the acceptance criteria for 2,4,5,6-tetrachloro-m-xylene (0%) and decachlorobiphenyl (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis were reported.

4.3 Remedial Investigation Procedures

To minimize mobilizations, extra step-out samples were collected from some locations. The analyses of these extra samples were put on hold at the laboratory and only analyzed if necessary for further delineation. This technique reduced the number of sampling events and the disturbance to onsite and offsite operations.

4.3.1 Utility Survey

New Jersey One Call was used for utility clearance.

In addition, prior to sample collection, a utilities survey was conducted by Subsurface Environmental Technologies, LLC (SET) in August 2019. The purpose of the survey was to clear potential soil sample locations and to identify possible underground utilities to assist in the remedial design process.

SET contacted the City of Trenton Sewer Department, which provided historic documents pertinent to the survey area. To meet the objective of the investigation, SET used the electromagnetic (EM), the ground-penetrating radar (GPR), hand-held electromagnetic (HHEM), and radiofrequency (RF) methods.

SET detected several buried pipelines in the survey area. An important storm line was found that ran from a manhole in Cook Avenue to the north, then angled to the east along a gravel access road. This line intersected three manholes. To corroborate the presence and location of this line, SET contacted The City of Trenton Sewer Department who forwarded a map from 1994 showing this line to SET. The line was designated as Drain 18 and it ran from Cook Avenue to Olden Road, to the east. It indicated the pipe was 5.5 feet in diameter (also observed by SET when opening the manhole covers), showed a similar position, and confirmed that three manholes were present in the survey area.

SET detected a water line that ran from a manhole in Cook Avenue to the north. This line then angled to the west where it ran below an existing water cap next to the trailer. This line provided water to the trailer. It then continued to the west below the railroad fencing.

SET also detected a sewer line that ran from a manhole on Cook Avenue to the north in roughly the same orientation as the water line described above. This line also angled to the west and terminated at a large manhole cover next to the trailer.

Several electric and unknown lines were also detected and marked on the ground with spray paint. Numerous site photographs were taken in the field and included with the report. It is important to note that large soil containers were present in the western side of the survey area during the investigation. As a result, the survey crew did not have access to this area.

SET detected sections of buried railroad track in the eastern part of the survey area. The track exhibited strongly negative EM responses in areas directly over and adjacent to the tracks. SET noticed that the buried tracks were partly an extension of existing tracks that were observed at the ground surface to the east.

The utility survey report is included in Appendix C.

4.3.2 Survey Control

Soil sample locations were surveyed by Dennis W. Sklar, Inc. The horizontal datum used is the New Jersey State Plane Coordinate System, North American Datum (NAD 83) and the vertical datum is the North American Vertical Datum (NAVD 88). The primary control was established by a set of dual frequency global positioning system (GPS) units referencing a control monument published by The National Geodetic Survey.

Topographic surveys were conducted and provide the basis for figures in the Soil Erosion and Sediment Control Plan (Appendix F).

4.3.3 Soil Borings

For the pre-design investigation, all soil borings were advanced by hand auger due to various Site obstructions, including unused rail spurs, underground utilities, above ground debris and topography. Samples were screened with a portable photo-ionization detector (PID). The PID was calibrated at the beginning of the workday and calibration records were maintained along with field notes in a permanently bound field book or tablet. After the Site geologist collected samples from a six-inch interval for laboratory analysis, the soil core was logged. Following completion, each borehole was backfilled, and all equipment and tools were decontaminated. The boring logs are included in Appendix D.

4.3.4 Sampling Methods

Sampling was performed in accordance with the procedures described in the NJDEP FSPM.

Soil samples were collected using decontaminated stainless-steel hand augers in six-inch increments. The samples were homogenized in stainless-steel bowls that were decontaminated after each sample. Once a consistent physical appearance over the homogenized soil had been obtained, the soil was transferred into the sample container using the decontaminated stainless-steel scoop. After sample collection, the sample jar was placed in a Ziplock bag inside an iced cooler. The chain of custody was completed and kept with the cooler.

4.4 Pre-Remediation Investigation Results

The purpose of the pre-design investigation was to further refine the areas that require remediation. A total of 252 samples were collected from 110 locations. The samples collected for the supplemental investigation are listed in Table 1. Samples were collected from the onsite rail yard area (AOC-1), the portion of the P. J. Hill property (AOC 2A) that is located on the Amtrak side of the fence, and the offsite Hutchinson property (AOC-2B). The full analytical data packages are included in Appendix E. EDDs have been previously submitted to NJDEP via e-mail.

All samples collected for this phase were analyzed for PCBs only. The analytical results have been reviewed and evaluated with the historical data to provide the basis for horizontal and vertical limits of excavation, based on concentrations of PCBs greater than 50 mg/kg (designated TSCA waste) and between 0.2 mg/kg and 50 mg/kg (non-TSCA waste).

Specific results are incorporated into the analytical results discussed in Section 5.0.

5.0 Areas of Concern

Because this rail yard includes a portion of the Northeast Corridor rail line, excavation adjacent to the active line within the rail yard is precluded at this time for safety and operational reasons. This RAWP addresses the portion of the railyard that is to the east of the fence that bisects the railyard, which is safely accessible for excavation activities. Note that the portion of the active railyard to the west of the fence is covered by plastic sheeting overlain by several feet of ballast, which prevents direct contact with contaminated soil. Amtrak personnel are required to take appropriate safety precautions if their work requires contact with subsurface soil. Contamination to the west of the fence in the active rail yard will be addressed in a future RAWP.

The following sections provide a comprehensive summary of investigation results for the areas to be addressed within AOC-1, a portion of AOC 2A and AOC-2B, including all data that provide the basis for this RA. The AOCs are shown on Figure 2. Analytical data are provided on Figures 3 through 8.

5.1 AOC-1 Northern Area (Phase 1)

5.1.1 Polychlorinated Biphenyls

In 2020, samples were collected from an additional 31 locations in the northern area. These results have been evaluated with the previous PCB data to further define the horizontal and vertical boundaries where PCBs exceed the NRDCSRS. PCB results are included in Table 3.

Based on these results, the areas and depths to be excavated were refined from prior estimates. All PCB analytical results and areas to be excavated are shown on Figure 3.

5.1.2 Volatile Organic Compounds

Based on the RI results, VOCs in soil are not present in concentrations that exceed SRS or IGWSSL in the portion of the northern area to be remediated. Analytical results for VOCs were presented in the 2017 RIR and are shown on Figure 5. As discussed in Section 3.4.2, areas where VOC results exceeded applicable standards are located directly adjacent to the active Northeast Corridor Rail Line and will be addressed in a future RAWP.

5.1.3 Semi-Volatile Organic Compounds

Several PAH compounds exceed applicable standards at one location in the northern area, D-4. Based on the historical data, benzo(a)anthracene (0.67 mg/kg), benzo(a)pyrene (0.7 mg/kg), benzo(b)fluoranthene (2.4 mg/kg), and dibenz(a,h)anthracene (0.27 mg/kg) exceed SRS and/or IGWSSL at one location. This location has been delineated and is within an area to be excavated due to elevated PCBs in soil. Analytical results were presented in the 2017 RIR and are shown on Figure 8.

5.1.4 Metals

Based on the analytical data as reported in the 2017 RIR, results for select metals exceeded the applicable IGWSSL in one location, D-4, in the northern area. Analytical results for lead (230 mg/kg) and mercury (0.2 mg/kg) were greater than their respective IGWSSL. This location is within

an area to be excavated due to elevated PCBs in soil. Analytical results were presented in the 2017 RIR and are shown on Figure 6.

5.1.5 Pesticides

Based on the analytical data as reported in the 2017 RIR, results for pesticides did not exceed applicable SRS or IGWSSL in the northern portion of the rail yard. No remediation is required for pesticides in this area. Analytical results were presented in the 2017 RIR and are shown on Figure 7.

5.2 AOC-1 Southern Area (Phase 2)

5.2.1 Polychlorinated Biphenyls

In 2020, samples were collected from an additional 58 locations in the southern area. These results have been evaluated with the previous PCB data to further define the horizontal and vertical boundaries where PCBs exceed the NRDCSRS. PCB results are included in Table 3.

Based on these results, the areas and depths to be excavated have been refined from prior estimates. The analytical results and areas to be excavated are shown on Figure 4.

5.2.2 Volatile Organic Compounds

Based on the RI results, VOCs in soil are not present in concentrations that exceed SRS or IGWSSL in the southern area to be remediated. VOC results are shown on Figure 5. As discussed in Section 3.4.2, areas where VOC results exceeded applicable standards are located directly adjacent to the active Northeast Corridor Rail Line and will be addressed in a future RAWP.

5.2.3 Semi-Volatile Organic Compounds

Several SVOC compounds exceed applicable standards at three locations in the southern area, PL-12 (0.0-0.5), D-13 (0.0-0.5), and PL-1 (0.0-0.5). Based on the historical data, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenz(a,h)anthracene results exceeded SRS and/or IGWSSL. These locations have been delineated and are within the area to be excavated due to elevated PCBs in soil. Analytical results were presented in the 2017 RIR and are shown on Figure 8.

5.2.4 Metals

Based on the analytical data as reported in the 2017 RIR, results for select metals exceeded the applicable IGWSSL in three locations, D-13, PL-1 and PL-12, in the southern area. Analytical results for antimony, beryllium, lead, and mercury were greater than their respective IGWSSL. These locations are within areas to be excavated due to elevated PCBs in soil. Analytical results were presented in the 2017 RIR and are shown on Figure 6.

5.2.5 Pesticides

Based on the analytical data as reported in the 2017 RIR, results for pesticides exceeded the NRDCSRS for dieldrin in D-13 (0.0-0.5) at 0.35 mg/kg. Location D-13 has been delineated and is located within the area to be excavated due to PCBs in soil. Pesticide results were presented in the 2017 RIR and are shown on Figure 7.

5.3 AOC-2A P. J. Hill Elementary School Property

As previously discussed based on a boundary survey, a small portion of the P.J. Hill school property was found to be located on the East Barracks side of the property fence line. This area was not remediated in 2019 with the majority of the P. J. Hill property.

In 2020, soil samples were collected from three additional locations in AOC-2A, for a total of six locations investigated in this area. Analytical results ranged from Not Detected (ND) to 11 mg/kg. Results greater than the RDCSRS were present at depths up to 2.5 feet bgs. Analytical results are included in Table 3 and Figure 3. This area is included in the planned exaction area indicated on Figure 3.

5.4 AOC-2B Hutchinson Property

Based on the extensive investigation activities on the rail yard as reported in the 2017 RIR, only PCBs had not been delineated to RDCSRS at the rail yard boundary. Wood conducted offsite RI activities as reported in the 2019 RIR. While PCBs were delineated for purposes of the RI, additional sampling was conducted in order for further define the area that required remediation.

As a result, sampling and analysis for PCBs was conducted in the adjacent offsite AOC-2B Hutchinson Property.

In 2020, soil samples were collected from an additional 20 locations for a total of 49 locations on the Hutchinson property. PCB results ranged from Not Detected (ND) to 5.28 mg/kg. The depths where PCB results exceeded the RDCSRS ranged from 0.5 feet bgs to 4.5 feet bgs. Analytical results are included in Table 3 and shown on Figure 3. The excavation area is for AOC 2B is indicated on Figure 3.

It should be noted that the fence that is present on the Hutchinson property does not reflect the property line. The actual property line is further to the west of the fence (Figure 2).

6.0 Remedial Action

As previously discussed, investigation activities have been conducted sitewide. Based on the analytical results, areas identified in this RAWP to be addressed by the proposed RA have been defined as AOC 1, AOC 2A and AOC 2B:

- AOC 1: Onsite area to the east of the fence that bisects the Site. Excavation to the west of the Site cannot be conducted safely as long due to rail yard and Northeast Corridor operations.
- AOC 2A: Offsite area that is part of the PJ Hill property but is inside the East Barracks property fence line. All soil with PCBs in excess of the RDCSRs of 0.2 mg/kg that was outside of the fence line was remediated in 2019. Only a small portion of the soil remains to be addressed under the proposed RA.
- AOC 2B: Offsite area that is part of the industrial Hutchinson property.

6.1 Summary of Nature and Extent of Contamination

PCBs are the primary contaminants of concern at this Site. Minor amounts of PAHs, metals and dieldrin exist at low concentrations. Addressing PCBs in soil will also address these other parameters that have exceeded applicable standards.

Residual amounts of Aroclor 1260, the dominant PCB type present at the Site, remain in shallow soil due to the compound's stability and resistance to biodegradation. The chemical stability of Aroclor 1260 also typically limits its mobility to deeper soils or groundwater in the environment. One additional PCB Aroclor, 1254, was also detected in two locations, PL-A (260 mg/kg) and E-72 (0.261 mg/kg). These areas will be included in the remediation.

Onsite PCB contamination is defined for remediation purposes as the area containing PCB concentrations exceeding 1 mg/kg (AOC 1). Offsite AOC 2A and 2B are defined as the areas with total PCB concentrations exceeding 0.2 mg/kg.

Approximately half of the contaminated soil is within the upper two feet beneath the ground cover (ballast and/or gravel) and the remaining contaminated soil is limited to the top four feet beneath the ground cover, which is typical of PCBs released into the environment. Comprehensive PCB soil analytical data accumulated from multiple soil sampling events in the areas to be excavated are presented on Figures 3 and 4. Areas to be excavated are also shown in the approved Soil Erosion and Sediment Control Plan (SESCP) provided in Appendix F.

The estimated total area containing total PCB Aroclors that exceed applicable standards is approximately 112,514 square feet and is comprised of 16 delineation areas, including the offsite area (see Appendix F). Horizontal and vertical delineation to the applicable standard was achieved in all areas except at the northern and southern ends of the Site where rail equipment precludes additional sampling.

The final limits of the excavations will be determined by post-excavation verification sampling.

6.2 Remedial Action Description

The remedial goals for AOC 1 are the NRDCSRS for PCBs, PAHs, metals and dieldrin. The remedial goal for AOC 2A and 2B is the RDCSRS for PCBs, which will allow unrestricted use of the offsite property.

The areas to be excavated have been further defined as exhibiting PCBs greater than 0.2 mg/kg but less than 1 mg/kg, greater than 1 mg/kg but less than 50 mg/kg and greater than 50 mg/kg. The quantities provided below are based on the most current data.

Phase	Area	Conc (mg/kg)	Area (sf)	Depth (ft)	Volume (cy)
South	EX-1	> 50	4,067	4	603
South	EX-2	< 50	45,833	2	3,395
South	EX-3	> 50	1,542	2	114
South	EX-4	< 50	1,147	4	170
South	EX-5	< 50	9,224	4	1367
North	EX-6	< 50	5,895	2	437
North	EX-7	> 50	1,425	2	106
North	EX-8	< 50	6,528	2	484
North	EX-9	> 50	1,760	2	130
North	EX-10	> 50	973	4	144
North	EX-11	> 50	6,245	2	463
North	EX-12	< 50	7,447	2	552
North	EX-13	< 50	5,558	4	823
North	EX-14	> 50	2,883	4	427
North	OFFSITE AOC-2A	> 0.2	1,507	4	22
North	OFFSITE AOC-2B	> 0.2	10,480	4	1,553
Total			112,514		10,991

The RA will be conducted in multiple phases. Phase 1 will include the offsite properties (AOC 2A and 2B) and adjacent portions of the northern area. Phase 2 will include the remainder of the northern area and Phase 2 will address the southern area. Preliminary remediation drawings are included in the approved SESCO (Appendix F).

6.3 Site Preparation and Controls

Prior to initiating soil remedial activities, the Site controls listed below will be implemented.

- A health and safety plan (HASP) will be developed specifically for the planned work activities. All workers will follow applicable Federal and State regulations regarding work activities, including but not limited to Occupational Safety and Health Administration (OSHA) regulations, respiratory protection, personal protective equipment (PPE), etc. This will include establishment of an Exclusion Zone (EZ), Contamination Reduction Zone (CRZ), and Support Zone (SZ) during excavation of all contaminated soil.
- Additional notifications and plans required for the work activities will be prepared and submitted to the NJDEP and local officials, as needed. In accordance with NJDEP regulations, all work will be overseen by a New Jersey LSRP.
- Prior to any work, the boundaries of the excavation areas will be marked, properly secured, and a utility mark-out will be requested from NJ One-Call. An underground utility survey was conducted in 2019; results are included in Appendix C.
- Soil erosion and sediment control measures will be constructed in accordance with the SESCO that was approved by the Mercer County Soil Conservation District. The SESCO is included in Appendix F.
- Railroad tracks within the area to be excavated will be removed prior to soil excavation. Tracks will be re-used or recycled as scrap metal.
- Railroad ties within the area to be excavated will be removed prior to soil excavation. Railroad tie disposition, whether disposal or reuse, will be completed in accordance with Federal, State, and local regulations.
- Tracking Pads will be established at the exit from the work area to prevent tracking of contaminated soil to uncontaminated areas.
- A truck wash station will be established at the exit from the work area.
- A contaminated soil stockpile/soil staging area will be established and operated in a manner to prevent contaminant release to the environment. The stockpile will not remain on the Site for more than 180 days. The final location of the stockpile/storage area is to be established during preparation of construction plans. This area will be utilized to temporarily store secure, lined, covered, and marked roll-off waste containers and/or lined and covered soil stockpiles until transportation offsite for proper disposal. Temporary berms or other soil erosion control measures will be constructed around this area. Additional soil erosion measures as required by the SESCO will be implemented. Access to the active soil stockpile and storage areas will be controlled through temporary fencing with controlled access points.
- Water misting will be used as a dust suppressant in the work zone but not as a means to control wind dispersion of stockpiled material. Stockpile materials will be covered daily. Every effort will be made to prevent fugitive dust or runoff from reaching any sensitive receptors or ecologically sensitive areas.

Air monitoring will be conducted during the active removal and handling of PCB-contaminated soils. To reduce dust levels and exposures to dust, a combination of engineering controls and PPE will be implemented as part of the work activities. The perimeter air monitoring plan is discussed in Section 7.5.

6.4 Mobilization

This task comprises the mobilization of the field office and equipment to the Site. Security will be provided by placement of a temporary chain-link fence equipped with a visual screen. Work zones will be established and marked. Mobilization will also include the marking of the area requiring excavation by a NJ Licensed Land Surveyor and utility mark out by the construction contractor.

The construction contractor will mobilize trailer, sanitation facilities, generator, equipment (excavator, front loader etc.), temporary fencing, soil erosion and sediment control measures to the Site and have a utility mark out conducted.

Vegetation will be cleared from the excavation area and fence removed, as necessary. Silt fence will be installed along the boundaries of the excavation and protection of the stormwater drains on the Site will be installed in accordance with the SESCO.

The laydown and storage area will be established on the Site in an area readily proximate to the area to be excavated.

Prior to the initiation of work, photo documentation of existing site conditions will be performed to provide a baseline for final site restoration.

6.5 Soil Removal

The horizontal and vertical limits of excavation have been determined by the results of multiple in-situ soil investigations conducted between 2002 and 2017. As described in Section 5.0, PCBs are the driving contaminant for the RA. Small areas where PAHs, metals and dieldrin are present will be removed with the PCB-contaminated soil.

The areas containing soil where PCBs exceed the applicable standard will be excavated along with any overlying ballast and transported offsite to a designated facility for disposal as bulk PCB remediation waste.

Soil removal is proposed in the areas presented in Figures 3 and 4. and in Appendix F. The total footprint of the areas subject to excavation encompasses approximately 112,514 square feet. Soil excavation depths will extend up to 4 feet bgs. Excavated areas and depths will be verified by post-excavation sampling.

Impacted soil will be excavated to the depths indicated in the remediation drawings. Based on PCB soil concentration, impacted soil will be transported to either a Subtitle D landfill or a TSCA landfill (including Subtitle C landfills permitted to receive PCB remediation waste).

Waste characterization samples will be collected for extractable petroleum hydrocarbons, VOCs, SVOCs, total metals, PCBs, toxicity characteristic leaching procedure Resource Conservation and Recovery Act metals, reactivity (sulfide, cyanide), ignitibility, pH and paint filter test.

Water entering the excavation will be collected and sampled for offsite disposal, if necessary. Dust suppression will occur concurrently with excavation activities.

Post-excavation sampling of soils will be performed to verify that the remedial goal for soil has been achieved. Sample locations will be surveyed by a NJ-licensed surveyor.

6.6 Dewatering

Although the planned maximum excavation depth is not anticipated to intersect the top of the water table, it may be necessary to dewater certain excavations periodically/temporarily after rain events. Dewatering equipment that will be used includes pumping equipment (e.g., trash pumps) hoses and piping, and sump construction. Anticipated dewatering rates are less than 5,000 gallons per day. Accumulated water will be pumped to onsite frac tanks and sampled prior to offsite disposal.

6.7 Backfilling

Excavation backfilling will be performed upon receipt of the analytical results for the confirmation soil samples and verification that the results show PCB concentrations remaining in-place meet applicable standards. The excavation will be dewatered, if necessary, to remove free standing water and backfilled with fill approved by the LSRP in accordance with the technical specifications and NJDEP requirements. The backfill will be compacted using mechanical compaction methods. Soil will be placed and compacted to 95% of maximum proctor density in 1-foot lifts via nuclear gauge methods (ASTM D6938) at a minimum frequency of one per 900 square feet. The approved backfill will be installed to within one foot of grade, after which the remaining surface restoration will be placed (e.g., 6 inches of gravel road base or topsoil for vegetation).

6.8 Waste Storage and Disposal

The following activities will be completed with regard to the proper storage and disposal of PCB remediation wastes in accordance with 40 CFR § 761.65(c)(9):

At the end of each workday, any open excavations will be secured by temporary fencing and lined with plastic;

A secure, lined, covered, and marked waste container (roll-off or equivalent) will be staged for the collection of PCB wastes greater than 50 mg/kg generated during the work activities in accordance with 40 CFR § 761.65.

Alternatively, soil may be temporarily stockpiled on plastic liner or direct loaded in transportation vehicles for temporary staging, sampling and analyses and eventual shipment to the disposal facility based on the soil acceptance procedure. A contaminated soil stockpile/soil staging area will be established and operated in a manner to prevent contaminant release to the environment in accordance with 764.65(c)(9). The stockpile will not remain onsite for more than 180 days. The final location of the stockpile/storage area will be established during preparation of construction plans. This area will be utilized to temporarily store secure, lined, covered, and marked roll-off waste containers and/or lined and covered soil stockpiles until transportation offsite for proper disposal. Temporary berms or other soil erosion control measures will be constructed around this area. All additional soil erosion measures as required by the Mercer County Soil Conservation

District will be observed. Access to the active soil stockpile and storage areas will be controlled through temporary fencing with controlled access points.

Containers will be properly labeled and marked in accordance with 40 CFR § 761.40.

Upon completion of the work or when a container is considered full, the waste will be transported offsite under manifests or bills of lading for disposal at an approved disposal facility. Soils classified as TSCA waste (greater than 50 mg/kg) will be segregated for disposal at a TSCA waste landfill or a Subtitle C landfill permitted for the disposal of PCB remediation waste.

Soil classified as non-hazardous waste (less than 50 mg/kg) may be placed in a separate waste container or temporarily stockpiled on plastic liner and will be segregated for disposal at a non-hazardous waste disposal facility.

Soil stockpiles will be surrounded with hay bales and shall be covered with plastic overnight, and at all times until disposal.

Copies of manifests, waste shipment records, bills of lading, and certificates of disposal will be collected and provided as part of the final remedial action report to USEPA.

Equipment will be decontaminated in accordance with 40 CFR § 761.79.

6.9 Equipment Decontamination Procedures

At the completion of use, construction equipment parts that were in contact with contaminated media will be decontaminated prior to demobilization. A dedicated decontamination pad will be constructed for this operation. Equipment tracks, excavator buckets, loader buckets and hand tools will be thoroughly cleaned with a pressure washer and soap. Truck tires will be inspected and washed as necessary within a truck wash station prior to leaving the Site. Decontamination (decon) wash water (including that generated from washing vehicles and equipment) from equipment will be collected, containerized and managed as TSCA waste. Additionally, the decontamination pad will likewise be disposed as a PCB-contaminated material. All personnel controls/equipment cabs will be thoroughly cleaned and wiped down with a soap/water wash.

6.10 Site Restoration

Following completion of backfill, excavated areas will be restored to pre-existing conditions consisting of gravel road area and vegetation. The restoration plan is included the Appendix F drawings.

6.11 Demobilization

All areas disturbed as a result from the RA will be restored. Prior to demobilization, Site clean-up activities will be performed to remove any debris, stockpiled materials, tools and waste related to the remedial activities. Once the Wood engineer confirms that the Site is orderly/clean and decontamination procedures are complete, authorization to demobilize remaining materials, Site personnel and equipment will be granted. Temporary facilities and subcontractors will also be demobilized.

7.0 Monitoring Plan

Sampling and analysis will be conducted in accordance with the Site-specific QAPP provided in Appendix B and as required by the USEPA approved SICP.

7.1 Confirmation Soil Sampling

The areas to be excavated have been defined by known level of contamination and applicable remediation standards, as discussed in Section 6.2. Sixteen discrete areas have been identified based on current data. Proposed verification sample locations are presented on Figures 9 and 10.

7.1.1 Sampling Plan

In order to concurrently comply with TSCA and NJDEP requirements, base samples will be collected using a 20-foot grid and sidewall samples will be collected at a rate of one sample per 30 linear feet of sidewall. The verification samples and locations will be consistent with the NJDEP *Technical Guidance for Site Investigation of Soil, Remedial Investigation of Soil, and Remedial Action Verification Sampling for Soil*, dated March 2015.

The process for locating post-excavation samples is as follows.

1. Once the pre-determined depth limits have been reached, the base of the excavation will be divided into grids with 20 feet by 20 feet spacing; one verification sample will be collected at each grid square; a minimum of four discrete base samples will be collected from each excavation.
2. Select one sidewall sample location for every 30 linear feet of sidewall or other appropriate spacing based on the configuration of the excavation to demonstrate horizontal compliance with the remediation standards. Collect samples at the top and bottom of each sidewall to demonstrate vertical compliance with the remediation standards. Bias sidewall sample locations and sample depths for each sidewall to the highest concentration based on RI delineation sample depth, type and characteristics of contaminant, and other indicators of potential contamination. Adjust sample depths based on the depth at which contaminants were discharged (surface versus subsurface) and the type and characteristics of the contaminants that will affect contaminant fate and migration.
3. If the analytical result from one grid square or sidewall show total PCB concentrations of less than the applicable standard, the area within that grid square will be considered clear for backfilling. If the analytical results from a grid square are greater than the applicable standard, an additional layer of soil will be removed from that grid square and the grid square will be resampled and analyzed. The depth of the additional excavation layer will be determined based on the analytical results and professional judgment. This procedure will continue until the sample results are below the applicable standard for total PCBs.

Wood will provide measurements in the field to determine sample locations, which will be surveyed by a New Jersey licensed surveyor.

In areas that have exhibited exceedances of applicable standards for PAHs, metals and/or dieldrin, samples will also be analyzed for these parameters.

In addition to the samples indicated above, in accordance with the NJDEP FSPM, duplicate samples will be collected at a frequency of one per 20 samples and field blank samples will be collected at a frequency of one per day. These samples will be submitted to the laboratory as part of the quality assurance/quality control (QA/QC) procedures associated with sample collection.

Samples will be transported to the laboratory under standard chain of custody procedures and analyzed for PCBs using USEPA Method 8082A, SVOCs by 8270D, metals by 6010C, and dieldrin by 8081B.

7.1.2 Confirmation Sample Identification

A unique project specific sample identifier will be assigned to each soil sample. The sample identifier will be entered on the chain of custody and noted in the logbook to track sample results. For verification soil samples, field personnel will use the format of “aa#-bb#cc(dd)” to assign unique identifiers for each soil sample:

- aa = Acronym (EB for onsite East Barracks; PJH for AOC 2A and HUT for AOC 2B) and number (#) designating Excavation Area
- bb = sample type (SW = sidewall, B = base) and number (#)
- cc = cardinal direction within excavation area (N=north, S=south, NW=northwest, etc.)
- (dd) = six-inch depth interval, e.g., 0 – 0.5, 2.0-2.5.

An example of a sample identifier for a verification soil sample is EB1-SW1N(1.5-2.0).

After each sample is labeled, field personnel will transfer the identical information from the label to a chain-of-custody form. The chain-of-custody form is a serialized document and provides a detailed summary form for the analytical laboratory to track samples. A map of each excavation showing sampling locations will also be prepared for reporting purposes. If a verification sample needs to be collected at the same location, each sample will be labeled similarly; e.g., relative to the example above: EB1-SW1N(2.5-3.0).

Blind duplicate samples will be labeled as “XX-” and the date of sample collection. Field blanks will be labeled with FB and date.

7.2 Waste Characterization Samples

Remedial activities will generate approximately 11,000 cubic yards of soil containing PCBs with concentrations greater than 1 mg/kg. PCB waste characterization will be performed to develop waste profiles and to identify waste disposal facilities using composite sampling methods with one sample per each 250 tons of soil generated or as in accordance with the disposal facility requirements.

Soil will be segregated by PCB concentrations less than 50 mg/kg and greater than 50 mg/kg. Grab samples will be collected from areas that best represent the waste stream being evaluated

for disposal. Composite samples will be homogenized in a disposable aluminum pan and the sample transferred into a clean sample jar.

Liquid waste characterization samples will be collected from drums or other containers using a drum thief or disposable poly-bailer. If two distinct phases of liquid are present in a drum, two separate drum thieves or bailers will be used to separately sample each phase. The sample(s) will be transferred into a container appropriate for the requested analysis.

7.3 Sampling Equipment Decontamination

Equipment (sampling bowls and trowels) will be cleaned before initiating Site work. Non dedicated sampling equipment will be decontaminated after each use. Cleaning will consist of hand washing using a laboratory-grade non-phosphate detergent, potable water, and scrub brushes, followed by a potable water rinse. Sampling equipment that directly contacts sample media (e.g., bowls) will be cleaned either using the following procedure:

1. Wash with potable water and a brush to remove particulate matter;
2. Wash with Alconox® (or equivalent) and potable water or distilled water;
3. Rinse with distilled water;
4. Allow equipment to dry; and
5. Wrap equipment with aluminum foil.

Field personnel will designate a decontamination area onsite prior to beginning excavation activities. The decontamination area will be covered with polyethylene sheeting to collect fluids produced during decontamination activities. Decontamination fluids will be containerized in steel 55-gallon drums or frac tanks.

7.4 Soil Sample Shipping Procedures

Immediately following sample collection, labeled sample containers will be placed in an insulated cooler containing crushed ice to chill samples to below 4°C. To prevent the sample labels from getting wet and to contain any breakage during shipment, each set of sample containers will be placed in zip-lock bags prior to being placed in the sample shipping container, (e.g. cooler). For those containers where the labels cannot be read once the container is prepared for shipment, the sample identification number, date, and time will be recorded on the outer zip-lock bag with an indelible marker. Field personnel will wrap glass containers with bubble wrap or other appropriate padding to prevent breakage during transport. Field personnel will follow the following steps for sample shipment:

1. Place the chain-of-custody record in a sealed bag and place chain of custody in cooler.
2. Seal the cooler with packing tape
3. Apply a custody seal on the cooler lid (if a third-party commercial courier is used).
4. Label coolers with job name, job number, date, time, contact name, and phone number.

5. Ship by third-party commercial courier or transfer directly to laboratory courier.

Wood will use chain of custody procedures to establish, document, and maintain custody of field samples. A complete chain of custody record will accompany samples during collection, during shipment to the laboratory, and during analysis. When transferring samples, the individuals relinquishing and receiving will sign, date, and note the time on the chain of custody record. Two copies (including the original) will accompany the samples to the laboratory. One copy will remain with the field team. The following information will be provided on the chain of custody form:

- Site name
- Sample identification
- Date and time of sample collection
- Name and signature of sampler
- Sample preservation
- Matrix
- Type of analysis
- Signature(s) of individual involved in sample transfers
- Delivery of samples to the laboratory and storage at 4°C or below

7.5 Perimeter Air Monitoring Plan

Air monitoring will be performed and documented whenever soils are being disturbed or processed. Airborne particulates will be continuously monitored throughout each workday at four Site locations using particulate dust monitors (Dust TRAK Aerosol Monitors) equipped with data loggers (one-minute average) and alarms. One air monitoring station will be established upwind of the work area, and three will be placed downwind of the work zone perimeter. Portable units will be used within the work zone.

If the action levels identified in the Perimeter Air Monitoring Plan (PAMP) are exceeded, the Wood field manager will immediately implement PAMP procedures including establishing a plan for reducing the dust levels at the Site. Suppression measures will typically include (but will not be limited to) spraying the ground surface or soil stockpiles with water to control fugitive dust. The PAMP is included in Appendix G.

Airborne particulate matter consists of many different substances suspended in air in the form of particles (solids or liquid droplets) that vary widely in size. Inhalation hazards are caused if the intake of these particles includes intake of vapors and/or contaminated dust. Particles less than 10 micrometers in diameter (PM₁₀), which include both respirable fine (less than 2.5 micrometers) and coarse (less than 10 micrometers) dust particles, pose the greatest potential health concern because they can pass through the nose and throat and get into the lungs.

During the performance of the planned remediation activities, particulate matter in the form of potentially PCB-affected dust may be generated. Dust may also contain elevated levels of arsenic, polynuclear aromatic hydrocarbons, pesticides and VOCs. The greatest potential for the

generation of affected dust is during the excavation and handling of contaminated soil. The primary dust control mechanism to be employed on the project will be the use of engineering controls (e.g. wetting the soils) and PPE. In addition, particulate air monitoring will be conducted during intrusive or dust-generating activities in the support zone (SZ) and perimeter of the exclusion zone (EZ). The SZ is the area just outside of the active work areas, in designated safe work zones or support zones. Particulate air monitoring will determine if fugitive dust particles are present in the ambient air within the designated SZ and/or at the EZ perimeter during active removal activities.

One air monitoring station will be located upwind of the EZ to represent background conditions and one station downwind of the EZ monitor potential receptors of soil disturbance activities. Up to two additional stations will be located in the SZ between the offsite school/residences and the EZ to monitor more sensitive receptors. The locations of the monitoring stations will be determined daily based on wind direction and potential receptors. Additionally, the perimeter air monitoring technician (PAMT) will have a mobile particulate dust meter to monitor specific areas based on Site conditions.

Dust concentrations in the SZ will be measured using a suitable real-time aerosol particulate monitor capable of determining ambient air fugitive dust concentrations to 0.001 milligrams per cubic meter (mg/m^3) and continuous electronic data logging at an appropriate time interval (e.g. concentration would be logged every 15 seconds). Air monitoring will be conducted while active removal activities are occurring, and readings will be recorded in the field book at a frequency of one reading per hour. Air monitoring equipment will be operated by the PAMT. Prior to the active removal actions and at periodic points during the project, air monitoring readings will be recorded to document background particulate matter concentrations.

If total particulate concentrations in the SZ or at the perimeter of the EZ exceed the action limit of $0.1 \text{ mg}/\text{m}^3$ above background (as specified below and incorporating background readings) and are sustained (i.e. greater than 15 minutes), an alarm will notify the PAMT and then additional dust suppression techniques to mitigate fugitive dust will be initiated. If applicable, the dust suppression techniques will involve the application of a fine mist of water over the area creating the fugitive dust condition. The water will be applied either by small hand-held sprayers, sprinklers, or hose nozzles. In the event that the total of airborne particulate cannot be maintained below the action limit in the SZ and at the perimeter of the EZ, then work activities will cease until sustained readings are below the action limit or the SZ or EZ designation is re-evaluated.

OSHA has published the following permissible exposure limits (PEL) (8-hour time weighted average [TWA]) for air contaminants (29 CFR § 1910.1000; Table Z-1).

Air Contaminant	PEL (8-hour TWA)
Total Dust	15 mg/m^3
Respirable Dust Fraction	5 mg/m^3
PCBs (54% Chlorine)	0.5 mg/m^3

In addition, USEPA has established a National Ambient Air Quality Standard for PM₁₀ of 0.150 mg/m³ (24-hr average).

A total airborne particulate action limit has been established for the soil excavation work to be conducted with consideration of the specific receptors, work activities, and OSHA PELs. The action limit applies only to air monitoring within the SZ and perimeter to the EZ; an action limit has not been set for the active work zones (exclusion zones) as engineering controls will be used within these zones.

Given the maximum anticipated PCB concentration in dust that may be generated during remedial activities, a conservative action limit of 0.1 mg/m³ above background will be maintained during Site work. Air monitoring at a location representative of background air conditions (i.e. a location upwind of the work area) will be conducted at the same frequency as SZ monitoring to obtain data representative of real-time background conditions. The action limit will be used to determine if and when additional engineered controls, PPE, and/or work stoppages would be necessary.

Air monitoring equipment will be calibrated according to manufacturer's specifications. Weather and other site conditions will affect the normal operation of the equipment, which will require routine maintenance. Weather conditions will be noted on daily air monitoring logs. It is expected that dust or other particulate matter will not be a concern on rainy or misty days.

7.6 Quality Assurance Project Plan

A Site-wide QAPP has been developed for the Site in accordance with NJDEP requirements (Appendix B). Specific information related to the project is summarized in the following sections.

7.6.1 Data Quality Objectives

Indicators of data quality, which include precision, accuracy (bias), representativeness, comparability, completeness, and sensitivity will be compared to specified acceptance criteria to ensure investigation objectives are met, as outlined in the QAPP.

7.6.2 Quality Control Sampling

Field data quality objectives for the sampling activities to be performed include: (1) collection of samples representative of Site conditions, (2) obtain meaningful data that demonstrate the PCB impacted soil has been removed to the project cleanup levels (for confirmatory samples), and (3) collection of duplicate samples (1 per 20 samples) and field blanks (collected from water run over decontaminated sampling equipment once per day).

7.6.3 Laboratory Quality Assurance/Quality Control

Once the laboratory has logged in the samples, their progress through preparation and analysis will be tracked and monitored. The approved/certified laboratory will appropriately store and analyze samples as required by the USEPA test method for the sample. Required laboratory QC checks, their required frequency, the established control limits, and the actions to be taken if the control limits are exceeded will be completed in accordance with the test method requirements. A quality control package will be provided with the laboratory data containing results for the field

duplicate sample and the laboratory matrix spike and matrix spike duplicate for each batch of 20 samples.

7.6.4 Data Review and Usability

All aspects of the project (e.g. field monitoring activities and laboratory analyses) will be examined to determine if any problems were encountered that might jeopardize the usability of the data for its intended purpose.

8.0 Permits and Notifications

Permits and notifications potentially required for execution of this RAWP were evaluated and are discussed below.

8.1 Permits

8.1.1 Soil Erosion and Sediment Control

Certification from the Mercer County Soil Conservation District (MCSCD) Soil Erosion and Sediment Control Plan Certification is required for land disturbance greater than 5,000 square feet. The SESCO has been approved by the MCSCD and is included in Appendix F.

8.1.2 City of Trenton Permits

The city of Trenton Water Department requires a permit to access fire hydrants. Water for site activities may be supplied via a connection to an existing fire hydrant proximate to the Site entrance on North Cook Avenue. A City of Trenton Hydrant Use permit will be secured by the contractor, if necessary.

Any other permits required by the City will be procured by the construction contractor.

8.1.3 Self-Implementing Cleanup Plan

In accordance with TSCA, a SICP for PCB remediation has been submitted to USEPA Region 2. The SICP was approved on March 13, 2020 (Appendix A).

8.2 Public Notification

Public notification in accordance with ARRCs has been performed by posting a sign near the site entrance. Documentation of public notice was provided to NJDEP on February 14, 2019.

8.3 LSRP Submittals

Several forms will be certified by the LSRP and submitted to the NJDEP online with this RAWP, including:

- CID Spreadsheet
- Authorization to Submit a Remedial Phase Report through the NJDEP online portal

An AOC-specific remedial action report will be prepared subsequent to the completion of all RA for AOC 1, 2A and 2B.

9.0 Fill Use Plan

This Fill Use Plan is based on the most recent version of the NJDEP *Fill Material Guidance for SRP Sites* (April 2015), hereinafter referred to as the NJDEP Fill Guidance. The Fill Use Plan addresses clean fill from an offsite source(s).

9.1 Imported Clean Fill

Backfill and materials for site restoration include:

- ¾ inch (nominal) clean Dense Graded Aggregate (DGA)

The sources of this material will be provided by the construction contractor for LSRP approval prior to mobilization. This submission will include documentation, as detailed below, from the source of each type of backfill is “clean”, i.e., all constituents are at or below NJ RDCSRS.

Sampling and analysis of the fill materials is required to be conducted in accordance with the NJDEP Fill Guidance. Documentation that the data for each type of fill meets this requirement shall be submitted by the contractor. Analytical results, as well as source information, will be included in the RAR for this project.

9.2 Fill Use Plan Documentation

The following information is required in accordance with Appendix B of the NJDEP Fill Guidance. Required information is provided below. This information will be provided by the construction contractor and will be documented in the RAR.

1. The location of the site of use and donor site(s) including state, county, municipality, address, block, and lot number.
 - a. To be provided by construction contractor
2. The names, contact information, and relationship of all persons involved with the source, preparation, and transport of the fill from the donor site to the receiving site.
 - a. To be provided by construction contractor
3. A description of the origination or donor site or AOC including use history from a PA or site review.
 - a. To be provided by construction contractor
4. The volumes of alternative fill or clean fill to be used or imported.
 - a. Estimated 11,000 cubic yards
5. Identification of the specific location(s) on the site where the use will occur on a properly scaled map.
 - a. See Figures 3 and 4, and approved SESCO (Appendix F).
6. The depth of groundwater on the receiving site, including method of determination.

- a. The depth to groundwater is approximately between 5 and 8 feet bgs.
7. The description of the geotechnical properties of the fill appropriate for the intended use.
 - a. DGA
8. The use of the area(s) of the receiving and donor site being as specific as possible.
 - a. The receiving site is a railyard and adjacent industrial property. All imported fill will be covered with gravel road base or topsoil and vegetation.
9. A discussion of the performance, effectiveness, and reliability of the proposed fill use and any potential negative impacts to human health, safety or the environment as a result of the use pursuant to the requirements at N.J.A.C.7:26E-6.4(d).
 - a. Fill used as backfill will meet applicable NJDEP requirements for unrestricted use; thus there are no potential negative impacts to human health, safety or the environment.
10. The tracking and QC requirements to ensure all shipments received are of the fill from the approved donor site(s).
 - a. For imported soil materials, weight tickets and virgin source letters or analytical results will be required for all incoming shipments of material.
11. The field sampling and QAPP where new data is generated.
 - a. The documentation (e.g., data deliverables) that the clean fill meets all applicable remediation standards and criteria and is free of extraneous debris or solid waste.

Documentation will be provided in the RAR to include:

- Field daily report(s) documenting the absence of field evidence of contamination, disturbance and/or suspect fill, extraneous debris or solid waste in the overburden soil to be reused as clean fill.
- Field daily report(s) documenting the absence of field evidence of contamination, extraneous debris or solid waste in load(s) of clean fill imported from an offsite source.
- If imported, clean fill certification from the offsite supplier with associated sample results appropriate for the source (quarry/mine/commercial supplier) compared to the NJDEP SRS.

All imported fill sources and fill characteristics will be approved by the LSRP prior to placement on the Site.

10.0 Site Restoration

Subsequent to the removal of contaminated soil, the Site will be restored to pre-existing conditions. Site restoration will include the following tasks.

- The base of the excavation will be compacted to achieve a minimum 95% density compaction. Compaction testing will be performed by a geotechnical laboratory retained by the contractor.
- DGA will be placed in 12-inch lifts and compacted to a minimum of 95% Proctor density. Compaction testing will be performed by a geotechnical laboratory retained by the contractor.
- The road base or vegetated areas will be replaced “in-kind” to match the existing conditions and as provided is the design specifications (Appendix F). The grade of the replacement paving will also be replaced “in-kind” so as to maintain the existing sheet flow towards the west.

11.0 Schedule

Remediation activities will be initiated after submittal of this plan and procurement of the remedial contractor by Amtrak. Due to the proximity of P.J. Hill Elementary School, which is located adjacent to the Site at the Site entrance, field activities are to be limited to summer months (July and August) commencing in July 2021. It is anticipated that the soil removal activities described in this plan will occur over three summer seasons. Remedial activities will be documented and completed in accordance with any conditions contained within USEPA's SICP approval. A tentative schedule is provided below:

Project Schedule During Each Annual RA Period

Task	Days
Mobilization	5
Clearing and Grubbing	5
Soil Erosion/Sediment Control Measures	2
Excavation, Sampling, Backfill	15
Loadout and Offsite Disposal	5
Site Restoration	5

12.0 Remedial Action Report

In accordance with N.J.A.C. 7:26E-5.7, a Remedial Action Report (RAR) will be submitted to the NJDEP. The RAR will include the information specified in N.J.A.C. 7:26E-5.7. The RAR will describe the RA implemented at the site and provide all necessary supporting data to demonstrate that the RA is complete. The RAR will include the following:

1. The general reporting requirements in N.J.A.C. 7:26E-1.6;
2. A presentation and discussion of all the information identified or collected, pursuant to N.J.A.C. 7:26E-1.10 through 1.16 and an updated receptor evaluation;
3. A summary of the findings and recommendations for each area of concern from the remedial investigation report prepared pursuant to N.J.A.C. 7:26E-4.9;
4. A description of the RA implemented;
5. A list of the remediation standards that apply to the RA;
6. Documentation that the RA is effective in protecting the public health and safety and the environment by demonstrating compliance with the applicable remediation standards;
7. "As-built" diagrams for any permanent structures associated with the RA;
8. A detailed description of site restoration activities;
9. The total remediation costs through the implementation of the RA;
10. Documentation of all types and quantities of waste generated by the RA, including copies of fully executed manifests or bill(s) of lading documenting off-site transport of waste;
11. Documentation of the source, type, quantities, and location of each clean fill used as part of the RA at the site; and
12. A description of each permit required and obtained to implement the RA.

Notes:

Bold Italics - Laboratory Reporting Limit (RL) is greater than standard and/or screening level.

Bold - Exceeds lowest applicable standard/screening level

Bold parameter - detected

D = The compound was reported from the Diluted analysis.

J = Concentration detected at a value below the RL and above the Method Detection Limit (MDL).

mg/kg - milligrams per kilogram.

U = Not Detected at the RL

IGWSSL - NJDEP Impact to Groundwater Soil Screening Levels per November 2013 Guidance (Version 2.0).

NRDCSRS - NJDEP Non-Residential Direct Contact Soil Remediation Standards per Soil Remediation Standards, last amended Sept 2017

RDCSRS - NJDEP Residential Direct Contact Soil Remediation Standards per Soil Remediation Standards, last amended Sept 2017

Notes:
Bold Italics - Laboratory Reporting Limit (RL) is greater than standard and/or screening level.
Bold - Exceeds lowest applicable standard/screening level
Bold parameter - detected
D = The compound was reported from the Diluted analysis.
J = Concentration detected at a value below the RL and above the Method Detection Limit (MDL).
mg/kg - milligrams per kilogram.
U = Not Detected at the RL
IGWSSL - NJDEP Impact to Groundwater Soil Screening Levels per November 2013 Guidance (Version 2.0).
NRDCSRS - NJDEP Non-Residential Direct Contact Soil Remediation Standards per Soil Remediation Standards, last amended Sept 2017
RDCSRS - NJDEP Residential Direct Contact Soil Remediation Standards per Soil Remediation Standards, last amended Sept 2017

Notes:
Bold Italics - Laboratory Reporting Limit (RL) is greater than standard and/or screening level.
Bold - Exceeds lowest applicable standard/screening level
Bold parameter - detected
D = The compound was reported from the Diluted analysis.
J = Concentration detected at a value below the RL and above the Method Detection Limit (MDL).
mg/kg - milligrams per kilogram.
U = Not Detected at the RL
IGWSSL - NJDEP Impact to Groundwater Soil Screening Levels per November 2013 Guidance (Version 2.0).
NRDCSRS - NJDEP Non-Residential Direct Contact Soil Remediation Standards per Soil Remediation Standards, last amended Sept 2017
RDCSRS - NJDEP Residential Direct Contact Soil Remediation Standards per Soil Remediation Standards, last amended Sept 2017

Notes:
Bold Italics - Laboratory Reporting Limit (RL) is greater than standard and/or screening level.
Bold - Exceeds lowest applicable standard/screening level
Bold parameter - detected
D = The compound was reported from the Diluted analysis.
J = Concentration detected at a value below the RL and above the Method Detection Limit (MDL).
mg/kg - milligrams per kilogram.
U = Not Detected at the RL
IGWSSL - NJDEP Impact to Groundwater Soil Screening Levels per November 2013 Guidance (Version 2.0).
NRDCSRS - NJDEP Non-Residential Direct Contact Soil Remediation Standards per Soil Remediation Standards, last amended Sept 2017
RDCSRS - NJDEP Residential Direct Contact Soil Remediation Standards per Soil Remediation Standards, last amended Sept 2017

Notes:
Bold Italics - Laboratory Reporting Limit (RL) is greater than standard and/or screening level.
Bold - Exceeds lowest applicable standard/screening level
Bold parameter - detected
D = The compound was reported from the Diluted analysis.
J = Concentration detected at a value below the RL and above the Method Detection Limit (MDL).
mg/kg - milligrams per kilogram.
U = Not Detected at the RL
IGWSSL - NJDEP Impact to Groundwater Soil Screening Levels per November 2013 Guidance (Version 2.0).
NRDCSRS - NJDEP Non-Residential Direct Contact Soil Remediation Standards per Soil Remediation Standards, last amended Sept 2017
RDCSRS - NJDEP Residential Direct Contact Soil Remediation Standards per Soil Remediation Standards, last amended Sept 2017

Self-Implementing Cleanup Plan
Approval Letter**

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION 2
290 BROADWAY
NEW YORK, NY 10007-1866

MAR 13 2020

Richard Mohlenhoff
Manager, Environmental Programs
National Railroad Passenger Corporation
400 West 31st Street, 4th Floor
New York, NY 10001

Re: East Barracks Rail Yard
East State Street & South Olden Avenue
Trenton, Mercer County, New Jersey 08611
Approval for Cleanup and Disposal of PCB Remediation Waste under 40 CFR
§761.61(a) and for Characterization and Verification Sampling under 40 CFR §761.61(c).

Dear Mr. Mohlenhoff:

This is in response to the January 27, 2020 document entitled "Self-Implementing Cleanup Plan (SICP) East Barracks Rail Yard," prepared by Wood Environment & Infrastructure Solutions, Inc. (WEIS), on behalf of the National Railroad Passenger Corporation (Amtrak), for the above-referenced site. This document will be referred to as the "Application." The polychlorinated biphenyl (PCB) contamination onsite is considered to be PCB remediation waste that is subject to the applicable cleanup levels under the federal regulations at 40 CFR §761.61(a)(4).

PCB concentrations exceeding 1 part per million (ppm) were discovered in both onsite and offsite soils in sixteen delineated areas covering approximately 112,514 square feet at depths down to four feet below ground surface. The highest observed concentration was 506 ppm. The proposed remedial action is to remediate all onsite soils with PCB concentrations in excess of 1 ppm, and all offsite soils with PCB concentrations in excess of 0.2 ppm, involving the excavation and offsite disposal of approximately 10,990 yards of PCB-contaminated soils.

With the exception of the characterization sampling requirements under Subpart N of 40 CFR §761 and the verification sampling requirements under Subpart O of 40 CFR §761, the proposed removal of PCB remediation waste meets the self-implementing cleanup and disposal requirements under 40 CFR §761.61(a). In addition, based on the proposed verification sampling, in accordance with 40 CFR §761.61(c), the United States Environmental Protection Agency (EPA) finds that this sampling, in the proposed remediation context, is acceptable for purposes of determining compliance with the High Occupancy Area PCB cleanup standard of 1 ppm.

EPA hereby approves Amtrak's Application, and it may proceed with the cleanup and disposal under 40 CFR §761.61(a) and (c) and the Application, subject to this Approval. This Approval also constitutes an order under the authority of Section 6 of the Toxic Substances Control Act (TSCA), 15 U.S.C. §2605. This approval only specifies the applicable requirements under TSCA and does not cite to or make any determinations regarding the requirements that may be applicable under other federal, state, or local law. TSCA disposal requirements do not supersede other, more stringent, applicable federal, state or local laws.

Please note that this Approval does not constitute a determination by EPA that the transporters or the disposal facilities selected by Amtrak are authorized to conduct the activities set forth in the Application. Amtrak is responsible for ensuring that its selected transporters and disposal facilities are authorized to conduct any such activities in accordance with all applicable federal, state and local statutes and regulations.

Should you have any questions concerning this matter, please feel free to contact me at (212) 637-3315 or have your staff contact Steve Ferreira at (212) 637-3759 or at ferreira.steve@epa.gov.

Sincerely,

Ariel Iglesias, Director
Land, Chemicals and Redevelopment Division

1.0 Problem Definition

This Quality Assurance Project Plan (QAPP) has been prepared by Wood Environment & Infrastructure Solutions, Inc. (Wood) to provide a description of the quality assurance (QA) procedures for proposed Remedial Actions (RA) to remediate contaminated soil at the East Barracks Rail Yard (Site) and offsite Hutchinson Industries, Inc. property located in the City of Trenton, Mercer County, New Jersey. The RA conducted at the Site will comply with both New Jersey Department of Environmental Protection (NJDEP) N.J.A.C. 7.26E *Technical Requirements for Site Remediation* (TRSR) and the NJDEP *Field Sampling Procedures Manual*, August 2005, updated 2011 (FSPM). This work is also being performed in accordance with various NJDEP guidance documents that have been issued through the NJDEP Site Remediation Program including the following.

- *Analytical Laboratory Data Generation, Assessment and Usability Technical Guidance* (NJDEP, 2014a)
- *Quality Assurance Project Plan Technical Guidance* (NJDEP, 2014b)
- *Data of Known Quality Protocols Technical Guidance* (NJDEP, 2014c)
- *Data Quality Assessment and Data Usability Evaluation Technical Guidance* (NJDEP, 2014d)

All work will be reviewed and approved by the Licensed Site Remediation Professional (LSRP) who was retained for this project.

1.1 Project Definition

This QAPP has been prepared specifically for proposed RA to address contaminated soil associated with historical operations at the East Barracks Rail Yard (Site), which have also extended onto the adjacent Hutchinson Industrial Property, Area of Concern (AOC) 2B. The goals and objectives of the project are to complete soil remediation in accordance with NJDEP requirements.

The RA consists of the excavation, offsite disposal of contaminated soil, and post-excavation sampling. Remedial actions will be overseen by Wood on behalf of Amtrak. All remedial activities performed for this project will be conducted in accordance with the TRSR - N.J.A.C. 7:26E and the current version of the NJDEP FSPM (NJDEP, 2005). There are no variances from the TRSR or applicable guidance documents associated with the proposed RA.

The scope of work for this project includes sampling and analysis for post-excavation soil samples for verification that the remediation is complete. Perimeter air monitoring for dust will also be conducted. Perimeter air monitoring is discussed in perimeter air monitoring plan that is attached to the Remedial Action Work Plan (RAWP).

Soil sampling will be conducted in accordance with the NJDEP 2015 *Technical Guidance for Site Investigation of Soil, Remedial Investigation of Soil, and Remedial Action Verification Sampling for Soil, March, Version 1.2* and the FSPM, Updated April 2011.

Summaries of the sampling program and analytical methods are provided in Table 1 and Table 2, respectively. The planned area to be excavated and sample grids are shown on Figures 1 and 2.

1.2 Background

This QAPP provides information related to NJDEP Case Number 00-03-20-1219-43 under Program Interest (PI) Number G000043212. This QAPP has been prepared to address a historical discharge of polychlorinated biphenyls (PCBs), which was initially reported by the Site operator, New Jersey Transit, on March 20, 2000. The discharge was attributed to leaking transformers from electric powered, self propelled rail cars.

Initial remedial activities began in 2001 and were limited to areas within the Site boundaries. Investigations subsequently indicated the need to extend the investigations to adjacent, off-site properties to complete delineation. Contaminants of concern include semi-volatile organic compounds (SVOCs), PCBs, pesticides (dieldrin), and metals, specifically lead, beryllium and mercury. These contaminants have been horizontally and vertically delineated at the Site. Details regarding the sampling and analytical results are included in the RAWP.

1.2.1 Physical Setting

1.2.1.1 East Barracks Rail Yard Site (AOC 1)

The East Barracks Rail Yard Site is located in the city of Trenton, Mercer County, New Jersey. The Site covers approximately 3.5 acres. Facilities present at the Site include an active rail line operated by New Jersey Transit, an employee parking area, and two crew quarters trailers. A communications fiber optic line runs below ground parallel to the northeast corridor.

The Site is located south of Assunpink Creek, which discharges to the Delaware River approximately two miles to southwest of the Site. Topography at the Site is generally flat with the exception of the rail lines that are slightly elevated. Relief across the Site is approximately two feet. The entrance to the Site (North Cook Street) is down a moderately sloping hill. A slight depression is present parallel to the fence line along the western side of the railroad tracks. (Roux, 2002)

1.2.1.2 P.J. Hill Elementary School (AOC 2A)

The PJ Hill Elementary School (AOC 2A) is located at 1010 East State Street, Block 25301 Lot 1. The property is bordered by East State Street to the east, North Cook Avenue to the south, AOC 2B (described below) to the north, and the East Barracks rail yard to the west. The property is relatively flat with a slight grade towards the rail yard (Site). Most of the property is covered by the school buildings constructed in the 1970's and paved parking areas. The portion of the property immediately adjacent to the rail yard (Site) is a paved parking lot.

PCB-contaminated soil in AOC 2A was excavated in 2019. This AOC was remediated to meet the NJDEP residential direct contact soil remediation standards (RDCSRS), as described in the 2020 Remedial Action Report (RAR).

1.2.1.3 Hutchinson Industries, Inc. (AOC 2B)

The Hutchinson Industries, Inc., property (AOC 2B), located at 1132 East State Street, Trenton Block 25401, Lots 1 and 2, is bordered by East State Street to the east, P.J. Hill Elementary School to the south, North Olden Avenue to the north, and the East Barracks rail yard (Site) to the west. The property is relatively flat with a slight grade towards the rail yard (Site). Lot 1 consists of buildings and paved areas. The portion of Lot 1 that is immediately adjacent to the rail yard (Site) is covered by a building and parking area bordered by a fence. Most of Lot 2 is a grassy area including the site cap required by a remedial action permit for soil. The portion of Lot 2 that is immediately adjacent to the rail yard (Site) is grass and bordered by a fence.

The area between the Hutchinson Industries, Inc., fence and the Site boundary consists of heavy brush with quantities of debris and trash.

1.2.2 Geology/ Hydrogeology

The surficial soils beneath and in the vicinity of the Site consist of the Galestown-Evesboro association according to the United States Department of Agriculture (USDA) Soil Conservation Service (SCS) in the report *Soil Survey of Mercer County*. Galestown-Evesboro soils are characteristically deep, excessively

drained, nearly level to gently sloping hills that are sandy throughout depth. (Roux, 2002) The Site is located in the northernmost section of the Atlantic Coastal Plain Province, approximately one mile south of the Fall Line. The Atlantic Coastal Plain is comprised of Cretaceous age unconsolidated or poorly consolidated layers of gravel, sand and clay. The Cretaceous formation present in Mercer County and at the Site is the Raritan, Magothy, and Merchantville Formations. These formations dip gently southeast at approximately 35 to 60 feet per mile, where the younger beds dip more gently than the older beds. Also present at the Site, overlying the Cretaceous sediments are unconsolidated stratified deposits of Quaternary age. These deposits can consist of stratified sand, gravel, and clay and were deposited during the Wisconsin Ice Age (Roux, 2002).

According to groundwater investigations conducted at the adjacent Hutchinson property (former NJ Transit/Mercer Bus Garage facility (AOC 2B)¹) located approximately northeast of the Site, groundwater in the area occurs under unconfined, water table conditions (Dames & Moore, 1998). Depth to groundwater at the adjacent former NJ Transit/former Mercer Bus Garage facility was encountered at a depth of 18 to 19.5 feet below ground surface (bgs) during the historical groundwater investigations. (Dames & Moore, 1998). The former Mercer Bus Garage facility is situated approximately eight feet in elevation above the East Barracks facility (Site); therefore, it is estimated that the depth to groundwater below the Site is approximately 10 feet bgs. The groundwater flow direction at the adjacent former NJ Transit / former Mercer Bus Garage facility (AOC 2B) was determined to be to the north, towards Assunpink Creek. The water table aquifer fluctuates seasonally, responding to changes in meteorological conditions. The shallow aquifer in the area of the Site is not a regional source for potable water. The major regional groundwater sources for potable water include the sand and gravel layers of the Raritan and Magothy Formations. Recharge for these aquifers occurs primarily from local precipitation at outcrop areas. (Roux, 2002)

¹ This property is currently the location of the Hutchinson Corporation facility that has been designated AOC 2B.

2.0 Project Organization

2.1 Project Team

Name and contact information for the project team are provided below.

Name/Role	Organization	Phone Number
Marlene Lindhardt / Project Manager and LSRP	Wood	(732) 302-9500
Marie Bevier / Quality Control Manager	Wood	(503) 639-3400
Nick Della Fave/ Site Safety and Health Officer (SSHO)	Wood	(848) 702-9159
Stephen Posten / Laboratory Manager	Wood, NJDEP Certification No. 18003	(732) 302-9500
Jim Todaro / Laboratory Project Manager	Alpha Analytical, Inc.; NJDEP Certification No. MA 935	(800) 624-9220

The laboratory that will be used for this project is Alpha Analytical, Inc (AA) of Westborough, MA. AA will perform all laboratory analyses and is certified by NJDEP for all analyses to be used for this project.

Wood field staff will collect all samples. Appendix A provides the chain of custody (COC) and Appendix B provides the field forms to be used for this project.

2.2 Special Training Needs

All field staff are required to have completed Amtrak safety training within the past year. Amtrak requires the use of Level D personal protective equipment (PPE) at a minimum, including orange traffic visibility vests.

3.0 Data Quality Objectives and Criteria for Measurement Data

3.1 Project Objectives

The objectives of the project are to collect required data to satisfy the regulatory requirements for this project. These requirements include confirmation that contaminated soil at concentrations greater than the applicable standards has been removed from the areas excavated. Data will be used to determine if remediation is complete.

3.2 Data Quality Objectives

Data quality objectives (DQOs) are intended to produce chemical analyses data of known quality (DKQ.) In order to obtain data of appropriate quality to meet investigation objectives, the laboratories selected by Wood will use US Environmental Protection Agency (USEPA) SW-846 methods for soil analyses, in accordance with applicable New Jersey deliverables requirements.

For the analysis of any samples for a parameter or category of parameters for which laboratory certification exists pursuant to N.J.A.C. 7:18, the laboratory will be certified for that specific parameter or category of parameters pursuant to N.J.A.C. 7:18.

DKQ requires the development of performance acceptance criteria that are expressed as data quality indicators (DQIs), including precision, accuracy (bias), representativeness, comparability, completeness, and sensitivity (PARCCS). These DQIs are discussed below and in the tables specific to the analytical methodologies required by NJDEP in the TRSR for this project. In each case, when possible, acceptance criteria are specified in the QAPP, which indicates “how good” the data will need to be for use, and to serve as an early warning system to allow corrective action to be taken in real-time before the entire project is completed. The acceptance criteria and tabular DQIs for the certified laboratory methods to be used for this project have been attached as Appendix C and are listed below. For each method and parameter, PARCCS acceptance criteria are described for the field and laboratory operations:

- Table 2 QAPP Worksheet All Matrices – Metals (ICP) USEPA SW-846 6010C
- Table 5 QAPP Worksheet All Matrices - Pesticides USEPA SW-846 8081A & B
- Table 6 QAPP Worksheet All Matrices – PCB Aroclors USEPA SW-846 8082 and 8082A
- Table 9 QAPP Worksheet All Matrices - Mercury SW-846 Method 7471B and 7470A
- Table 14 QAPP Worksheet All Matrices – SVOAs by USEPA SW-846 8270D
- AA Standard Operating Procedure for Compendium Method TO-10A

Specific DQOs for field work are identified in the applicable NJDEP technical guidance documents. Laboratory DQOs include providing data at method detection limits (MDLs) and laboratory reporting limits (RL), which should be less than the applicable action levels, specifically 0.2 milligrams per kilogram (mg/kg) for PCBs. The following sections list the applicable guidance documents and regulatory requirements specific to this project.

3.3 Technical Standards

The technical standards to be applied to this project are provided in the most recent, applicable NJDEP guidance documents including the following:

- Technical Guidance for the Attainment of Remediation Standards and Site-Specific Criteria September 24, 2012, Version 1.0 (NJDEP, 2012)
- Technical Guidance for Site Investigation of Soil, Remedial Investigation of Soil, and Remedial Action Verification Sampling for Soil, Version 1.2, March 2015 (NJDEP, 2015)
- FSPM, August 2005, Updated April 11, 2011 (NJDEP, 2005)

3.4 Regulatory Standards

The regulatory action levels to be met during this project are provided in the most recent versions of applicable NJDEP regulations and guidance documents including the following:

- N.J.A.C. 7:26D Soil Remediation Standards (SRS)
- 40 CFR 761.61(a - c) USEPA Toxic Substances Control Act

For the East Barracks Rail Yard property (Site), the NJDEP non-residential direct contact soil remediation standard (NRDCSRS) of 1.0 mg/kg for delineation and remediation of PCBs will apply. The RDCSRS of 0.2 mg/kg for delineation and remediation of PCBs will apply for offsite properties.

3.5 Precision

Precision is the measure of agreement among repeated measurements. The following procedures will be used to determine the precision of the data:

- Use the same analytical methods to perform repeated analyses on the same sample (laboratory or matrix duplicates); and
- Split a sample in the field (field split) or collect a field duplicate and submit both evaluating the precision from sample collection and storage and analytical measurements.

Precision for laboratory and field measurements can be expressed as the relative percent difference (RPD) between two duplicate determinations or percent relative standard deviation (%RSD) between multiple determinations. Acceptance criteria for laboratory precision are specified in the method or laboratory standard operating procedure (SOP).

Results of all field duplicate analyses will be compared and RPDs calculated and presented in the validation reports. Poor overall precision may indicate field sample non-homogeneity, improper field sampling techniques, sample transport problems or analytical issues as reflected in the laboratory replicate analyses. Data will be evaluated on an ongoing basis so that if the cause of poor precision appears to be sampling procedures or laboratory method implementation, corrective actions will be taken. If project precision goals are not met, data must be interpreted accordingly and the uncertainty for specific locations or a specific parameter be considered in the usage of the data.

3.6 Accuracy

Accuracy is the degree of agreement of a measured value with its true value. It should be noted that precise data may not be accurate data. Accuracy can be expressed as a percent recovery or percent deviation of the measurement with respect to its known or true value.

Accuracy will be determined through establishing acceptance criteria for spike recoveries (e.g., surrogate recoveries, laboratory control sample recoveries, matrix spike (MS) recoveries, reference material recoveries etc.) or allowable deviations for calibration (e.g., %RPD for calibration verification). Acceptance criteria for MS measurements are expressed as a percent recovery and are specified in the analytical method or laboratory SOP.

For the purpose of this section, bias is defined as the constant or systematic distortion of a measurement process, different from random error, which manifests itself (usually in one direction) as a persistent positive or negative deviation from the known or true value (resulting ultimately in uncertainty with regard to an analytical result). This may be due to (but not limited to) improper sample/data collection, sample matrix, poorly calibrated analytical or sampling equipment, or limitations or errors in analytical methods and techniques.

In the case of an analytical test result(s) from an environmental sample containing an unknown concentration of a particular analyte, there will always be a “true” concentration and an associated uncertainty that is some representation of the extent of deviation that the test result has from that true value. Uncertainty should not be confused with accuracy, even though accuracy is a constituent of the total uncertainty of a measurement. Accuracy is simply how far off the analytical result is from the true value.

Accuracy and bias will be evaluated during data validation through review of quality control (QC) measurements such as initial and continuing calibration, method blanks, surrogate recoveries, laboratory control samples, and matrix spikes. Potential bias to individual results as evidenced by exceedances of the control limits presented in this QAPP will be summarized and reviewed. Particular attention will be paid to any apparent trends or consistency in bias for a particular analyte or sample matrix. The resulting uncertainty in the data must be considered for the different uses planned.

3.7 Representativeness

Representativeness is the extent to which measurements represent the site conditions. In general, the whole system, process, or situation of interest cannot be measured. Instead, sample locations, quantities, and analyses are chosen in order to capture a sufficiently broad and/or weighted view of the situation. The TRSR (N.J.A.C 7:26E 3.4(a)1; N.J.A.C 7:26E 3.5(a)1; and N.J.A.C 7:26E 3.6(b)1) requires the collection of samples biased towards suspected contamination (i.e., collect samples from areas of elevated photo-ionization detector [PID] readings, staining, odors, etc.).

Representativeness is the degree to which data accurately and precisely represent a parameter variation at a sampling point or an environmental condition. The results of all analyses will be used to evaluate the data to determine if the samples were collected in such a manner that the results appropriately describe the area investigated.

Sampling will be conducted in accordance with the NJDEP FSPM. Sample locations will be selected based on NJDEP requirements for post-excavation verification samples in accordance with applicable NJDEP guidance documents for sampling areas of concern. Specific sample intervals will be biased high based on visual observation or field monitoring instruments.

Representativeness of laboratory data will be achieved by following standardized procedures for subsampling.

3.8 Comparability

Comparability is defined as the extent to which data from one data set can be compared directly to similar or related data sets and/or decision-making standards.

Comparability is the degree to which data from one study can be compared with data from other similar studies, reference values (such as background), screening values and remediation standards. Field procedures in accordance with the NJDEP FSPM will be implemented to promote comparability of collected samples.

Comparability of laboratory results will be achieved by following standardized analytical procedures, using traceable reference materials, using Class A volumetric glassware or correctly calibrated pipettes for volumetric procedures, using correctly calibrated balances for gravimetric procedures, and following good laboratory practices.

Wood will insist on strict adherence to method QC and procedural requirements and the requirements of this QAPP, or proper documentation by the laboratory of deviations from the analytical methods. If undocumented method deviations are discovered during data validation, Wood chemists will evaluate potential effects on data usability and comparability, and will contact the laboratory for corrective action.

3.9 Completeness

Completeness is a measure of the amount of usable data collected compared to the amount of data expected to be obtained. Three measures of completeness are defined:

- Sampling completeness, defined as the number of valid samples collected relative to the number of samples planned for collection;
- Analytical completeness, defined as the number of valid sample measurements relative to the number of valid samples collected; and
- Overall completeness, defined as the number of valid sample measurements relative to the number of samples planned for collection.

The data completeness is determined as the percentage of usable data points compared to the number of samples collected for a specific analysis or matrix. Lack of completeness may be the result of sample loss during transport or analysis or rejection due to unacceptable quality control results for the analysis. No data that are rejected based on the validation will be considered usable for project purposes. Data completeness will be evaluated with respect to each intended use. Lack of completeness for a data set may have different impacts based on use; for example, risk assessment versus flow and solute transport modeling.

Because the analytical results will be used to verify that contaminated soil has been removed, the completeness goal is 90%.

3.10 Sensitivity

Sensitivity refers to the ability of an analytical procedure to quantify an analyte at a given concentration. The sensitivity requirements should be established such that the laboratory method RLs are at or below the relevant and applicable regulatory limits for each contaminant of concern for the project. For the purpose of this QAPP, the RL is defined as the lowest initial calibration standard as adjusted for the dilution factor, sample weight/volume, and moisture content.

Methods for analysis should be chosen to meet the sensitivity requirements for a project (e.g., compound- and matrix-specific). If however, the laboratory RLs exceed the project sensitivity requirements (i.e., the RL is greater than the relevant and applicable regulatory standard), the analytical methods may need to be adjusted (e.g., analysis conducted using a more sensitive method or sample preparation and analysis features adjusted to gain sensitivity) and/or the project objectives may need to be adjusted (i.e., certain contaminants of concern may not be able to be screened out during this phase of the evaluation)

The minimum concentrations that are required to achieve DKQ are defined by the applicable regulatory standard or screening levels. The regulatory action levels to be met during this project are provided in the most recent, versions of applicable NJDEP regulations and guidance documents including the following:

- N.J.A.C. 7:26D Soil Remediation Standards (SRS)
- 150 $\mu\text{g}/\text{m}^3$ (micrograms per cubic meter) (24-hour average) for PM_{10} for dust (USEPA 40 CFR Part 50)

RLs presented in this QAPP are defined by the method and are set at the concentration of the lowest applicable regulatory standard or criterion. These limits may not be achievable for samples with significant interferences, and the usability of data in these cases may be limited. RLs greater than screening levels or standards will not allow a demonstration of compliance with applicable action levels. Wood will review those instances where RL objectives have not been met, and if the measurements at their respective RLs are considered critical for project purposes, resampling or other corrective measures may be taken.

4.0 Investigation Process and Procedures

4.1 Historical and Secondary Information / Data

Wood completed remedial investigations (RI) of the Site in 2017 and offsite areas in 2019. Additional pre-excavation sampling was conducted in 2020; results are included in the RAWP. Data generated are being used to determine the planned horizontal and vertical limits of excavation. The pre-excavation soil data had been reviewed for QC purposes during the RI and are considered acceptable for use as the basis for estimating the area to be excavated.

4.2 Investigation Process Design

4.2.1 Post-Excavation Soil Sampling

Verification sampling will be conducted to confirm that the RA has been successfully completed and that soil with PCB concentrations greater than the applicable standards, have been removed. In several locations, SVOCs, pesticides (dieldrin), lead, beryllium and mercury will also be analyzed.

Post-excavation soil sampling will be performed in accordance with the requirements of the NJDEP *Technical Guidance for Site Investigation of Soil, Remedial Investigation of Soil, and Remedial Action Verification Sampling for Soil*, March 2015.

The areas to be excavated have been defined based on the site investigation (SI) and RI sample results (Figures 1 and 2.) Based on the applicable guidance for excavation, the minimum post remediation sampling frequency for this Site are:

- Select one sidewall sample location for every 30 linear feet of sidewall or other appropriate spacing based on the configuration of the excavation to demonstrate horizontal compliance with the remediation standards. Collect samples at the top and bottom of each sidewall to demonstrate vertical compliance with the remediation standards. Additional samples may be needed at other depths in a sidewall to demonstrate vertical compliance with the remediation standards. Bias sidewall sample locations and sample depths for each sidewall to the suspected highest concentration based on depth of the data from SI and RI sample locations, type and characteristics of the contaminant, field screening, and other indicators of potential contamination (e.g., evidence of staining). Adjust sample depths based on the depth at which contaminants were discharged (surface versus subsurface) and the type and characteristics of the contaminants that will affect contaminant fate and migration.
- Collect one sample from the excavation bottom area for every 900 square feet (SF). Bias excavation bottom samples within each 900 SF to the suspected highest concentration based on field screening data from SI and RI sample locations, type and characteristics of the contaminant, and other indicators of potential contamination (e.g., evidence of staining).

Table 1 summarizes the soil sampling plan. Because the exact location and quantities of samples will be determined in the field, exact details are not included in the summary. Table 2 summarizes the analytical methods including the sample preservation requirements, container types, and holding times.

Wood will record measurements in the field of the sample locations, which will subsequently be surveyed by a New Jersey licensed surveyor or by GPS.

The verification soil sample results will then be evaluated to determine if remediation is complete. If additional excavation is necessary, the methodology described above will be repeated.

4.2.2 Perimeter Air Monitoring

As detailed in the Perimeter Air Monitoring Plan (PAMP) that is attached to the RAWP, one air monitoring station will be located upwind of the soil disturbance activity to represent background conditions and two additional air monitoring stations will be located downwind of the excavation perimeter to monitor potential receptors of soil disturbance activities. As wind directions change, the monitoring stations may be relocated. The actual locations of each monitoring station will be documented daily. The stations will be located 4 feet above grade.

Background perimeter air sampling will be conducted to establish a baseline for the duration of the project and report ambient air concentrations of PCBs prior to intrusive work. Background sampling will be performed for a minimum of three days during fair weather conditions (i.e., no precipitation and/or relative humidity < 90%) prior to commencement of the work. Upon completion of the baseline sampling activities, the data will be tabulated to establish a pre-excavation baseline.

Real-time air monitoring for airborne dust will be monitored to provide time-weighted average (TWA) concentrations that are stored in the data logging memory. In addition, PM₁₀ concentrations and weather data will be recorded hourly.

Confirmatory perimeter air sampling for PCBs will be conducted for the duration of the project to confirm the accuracy and precision of the real-time screening data and to show compliance with perimeter air action limits. Samples will be collected over an 8-hour period, from a downwind location or the location that is likely to have the highest concentration of airborne contaminants.

Confirmatory sampling will be conducted at the following frequency:

- A minimum frequency of one sample/week applies for each separate ground intrusive action at a project.
- If an alarm condition occurs, air samples will be collected to confirm action level exceedance. For respirable particulate matter alarms, a sample will be collected for the remainder of the workday following the alarm condition from the location of the alarm condition / respective air monitoring station based on wind direction.

4.3 Investigation Methods

The investigation methods are discussed below. All project sampling will be performed in accordance with the NJDEP FSPM and other applicable NJDEP guidance documents.

Table 2 provides a summary of the analytical methods including sample container types, preservation requirements, and holding times.

4.3.1 Equipment and Supplies

The investigation will utilize the following equipment and supplies:

- Stainless-steel trowels and bowls.
- Lab-cleaned sample containers of the proper size and composition provided by the laboratory.
- Bound field logbook to record notes, observations, and other pertinent information.
- Camera or cell phone to photo-document activities.
- Appropriate paperwork (e.g., Chain of Custody, Logging and Calibration forms).
- Sample labels.

- Reagents, preservatives, coolers and a means to maintain sample temperature at 4°C.
- Portable field screening instrumentation (e.g., photoionization detector).
- Prescribed PPE for the scope of work (e.g., disposable nitrile gloves, eye protection) – refer to the Site-Specific Health and Safety Plan (HASP).
- Decontamination equipment and supplies for personnel and/or equipment (e.g., deionized water, Alconox, brushes, paper towels, etc.).
- Absorbent pads.
- Plastic bags for containerizing contaminated items.
- Clean plastic sheeting and table(s) to inspect and prepare samples.
- Aluminum foil and sealable plastic bags for protecting sampling equipment between locations.
- Packaging materials for sample shipment and custody seals for shuttles.

Additional supplies and equipment, as necessary.

4.3.2 Soil Sampling

Post-excavation soil samples will be collected from bottom and sidewall locations of the excavated area. Samples will be collected in discrete 6-inch increments using stainless steel trowels that are decontaminated between samples. Soil will be homogenized in stainless-steel bowls in accordance with the FSPM requirements.

All non-dedicated equipment used for soil sampling (e.g., stainless steel bowls and trowels) must be decontaminated prior to use and in between sample locations. Once the equipment has been cleaned, it must be protected from incidental contact (cross-contamination) by wrapping it in aluminum foil or placing it in a sealable plastic bag.

The quantity of soil samples is dependent on both the requirements of the NJDEP in the *Technical Guidance for Site Investigation of Soil, Remedial Investigation of Soil, and Remedial Action Verification Sampling for Soil*, March 2015, and conditions encountered in the field. Each soil sample will be labeled for sample identification and shipment via Federal Express (unless courier arrangements are made with the laboratory). Chain-of-custody documentation will be completed for all samples collected at the Site and will accompany the samples to the laboratory.

4.3.3 Ambient Air Sampling

Ambient air samples will be collected during ground intrusive activities (excavation only) to confirm the accuracy and precision of the real-time screening data and to show compliance with perimeter action levels, in accordance with the procedures detailed in the PAMP contained in the RAWP. Real-time measurements of particulate matter (dust) will be collected with a dust meter (DUST TRAK, or equivalent). Confirmatory ambient air samples for PCBs will be collected over an 8-hour period with a poly-urethane foam (PUF) cartridge. Ambient air samples will be collected from a downwind location or at a location suspected to have the highest concentration of airborne contaminants.

The quantity of ambient air samples to be collected is dependent on the duration of the project, number of days of background sampling, and action level exceedance confirmatory sampling. Each ambient air sample will be labeled for sample identification and shipment via Federal Express (unless courier arrangements are

made with the laboratory). Chain-of-custody documentation will be completed for all samples collected at the Site and will accompany the samples to the laboratory.

4.3.4 Decontamination

4.3.4.1 Heavy Equipment

Heavy equipment associated with a sampling episode must be cleaned prior to usage. Heavy equipment, such as backhoes and excavators, represent potential sources of interference and cross-contamination in environmental samples. Heavy equipment may inadvertently come in contact with non-target materials adjacent to the matrix being sampled or may cross-contaminate actual sampling equipment that had previously been cleaned in accordance with procedures set forth above. Heavy equipment may also potentially retain contaminants from other sources such as roadways, storage areas or previous job sites. In addition to initial onsite cleaning, heavy equipment must be cleaned between use at each sample location. (Refer to ASTM D-5088-90).

Two options are available to accomplish cleaning of heavy equipment: manual scrubbing and steam cleaning.

Manual scrubbing uses brushes, Alconox-water solutions, and potable water to remove visible debris and residual contamination from machinery components, such as excavator buckets, that had contacted the sampling matrix.

The use of a steam generator is more advantageous than manual scrubbing. Steam generators using potable water provide a heated and high-pressure medium that is very effective for the removal of both visible debris and residual contamination. Steam generators are also more efficient with respect to ease of handling and generation of low volumes of wash solutions.

When possible, heavy equipment decontamination via steam generator will be selected over manual scrubbing.

4.3.4.2 Sampling Equipment

Stainless steel bowls and trowels will be used to collect soil samples during the investigation and will be cleaned between sample locations. The field sampling equipment cleaning and decontamination procedures are as follows:

1. Laboratory grade glassware detergent (e.g., Alconox) and tap water scrub to remove visual and residual contamination.
2. Generous tap water rinse.
3. Distilled and deionized (ASTM Type II) water rinse.

Following decontamination, field sampling equipment will be wrapped in aluminum foil or placed in sealable plastic bags to prevent incidental contact (cross-contamination).

4.4 Field Quality Control

Quality control (QC) samples for this project include equipment-rinsate blank sample and field duplicate sample collection.

Equipment blanks are water samples collected from decontaminated sampling equipment using laboratory-supplied deionized (ASTM Type II) water. The purpose of an equipment blank is to demonstrate that the prescribed decontamination procedures successfully remove visible and residual contamination from the

non-dedicated sampling equipment. Concentrations of contaminants detectable in equipment blank samples indicate that the non-dedicated sampling equipment was not been properly cleaned and cross-contamination between sample locations is possible. If equipment blank samples exhibit concentrations of contaminants, Wood field personnel will re-evaluate the decontamination procedures. Revisions to the decontamination procedure of sampling equipment may also be necessary. Equipment blanks will be collected at the rate of one per day.

Field duplicate samples are split or replicate samples collected from the homogenized soil at a sample location. Duplicate samples are used to evaluate the sampling technique and homogeneity/heterogeneity of the sample matrix. Field duplicate samples will be collected at the rate of one per 20 soil samples.

Table 2 includes the planned QC samples for this project.

4.5 Field Instrument/Equipment Calibration and Frequency

No field instrumentation requiring calibration is required for the soil sampling activities.

The following field instruments for air monitoring will be used for this project:

- Dust Meter, Dust TRAK, MIE Data Ram, or equivalent with data logging capability, and audio/visual alarm, and
- Davis Vantage Pro2 or equivalent, meteorological weather station with automatic data logging capabilities. This instrument will require set-up at an elevation of approximately six feet above ground surface.
- Low-volume air sampler with PUF cartridges for PCBs

Prior to the initiation of the field investigation, a preventative maintenance and calibration program will be implemented to ensure proper operation of the field instruments. The field personnel will be familiar with the maintenance, calibration, and operation of field equipment and will perform the prescribed field operating procedures outlined in the Operations Manuals accompanying each instrument.

Field instruments used during sampling will be checked for calibration consistent with manufacturer-recommended procedures. Field instrument operating manuals are included in the PAMP.

If at any point in the project equivalent equipment of different make and model is utilized, copies of the relevant manufacturer manuals will be obtained and reviewed.

4.6 Inspection/Acceptance of Supplies and Consumables

The laboratory will supply all sample collection bottles and coolers to be used for this project. Upon receipt of the coolers, the contents will be inspected to ensure that the proper quantity, size and type of container have been provided. If any issues are found (e.g., missing/broken bottles), the laboratory will be contacted immediately for replacement containers.

4.7 Sample Handling and Custody Requirements

A summary of container types, holding times, and preservation requirements, (including temperature requirements) is provided in Table 2. Sample preservation, containers, and holding times are summarized in Appendix 2.1 of the NJDEP FSPM. Samples will be tracked by use of COC from the field to laboratory. The project COC form and sample labels are included in Appendix A.

4.7.1 Field Chain of Custody Procedures

COC records will be used to document sample collection and shipment to the laboratory for analysis. The COC is an integral component of the sampling process and represents the permanent record of sample holding and shipment. Forms will be completed when the samples are packaged for shipping to the laboratory. Until that time, the samples will be maintained in the custody of the Wood field team; that custody will include the identification of samplers in the field and personnel in the field office. Once the samples are packaged, the COC form will be placed in the cooler and sent with the samples for each shipment. If multiple coolers are sent to a single laboratory on a single day, one form will be completed for all samples per shipment.

Coolers will be packed with samples designated for a single laboratory. The COC record will identify the contents of each shipment and maintain the custodial integrity of the samples. The COC form will be crosschecked for errors and signed by the designated Wood field representative.

The Wood field representative will sign the “relinquished by” box and note the date, time, and air bill (if applicable). Until the samples are delivered, the custody of the samples will be the responsibility of the Wood field representative and will be kept in a secured area that is restricted to authorized personnel. A laboratory representative will check samples with their respective COC form(s) into the laboratory, and the form will be signed and dated appropriately. The Wood field representative or staff member will retain one copy of the signed COC form for the project files.

The COC form is provided in Appendix A.

4.7.2 Laboratory Sample Custody Procedures

The COC form will be signed on receipt by the laboratory to complete the custody chain. The condition of the samples upon receipt by the laboratory will be documented on a cooler receipt log or sample condition upon receipt form. This form will note sample integrity, preservation, temperature, custody seal condition, and will note any discrepancies between information on the sample labels and that on the COC custody form.

4.7.3 Sample Identification Procedures

Each sample will be logged into the laboratory information management system (LIMS) by assigning it a unique sample number. This number and the field sample identification number will be recorded on the laboratory report. Samples will be stored and analyzed according to specified USEPA and/or NJDEP methods. The original COC form will be returned to Wood for permanent storage.

4.7.4 Laboratory Chain-of-Custody Procedures

Once the laboratory has logged in the samples, their progress through preparation and analysis will be tracked and monitored through the LIMS. The analysts will be required to sign out samples from the sample storage area or refrigerator by entering their initials, date and time of sample removal. The samples will be taken to the appropriate analytical section for preparation and analysis where all procedures will be documented in laboratory notebooks or forms and on run logs. Dates of preparation and analysis will be entered into the LIMS. Sample results will be entered into the LIMS either through direct download from the instrument or manually. Unused sample portions and extracts will be returned to the sample storage area and signed back in. The sample or extract will remain in storage at the laboratory until the disposal time period is reached. Disposal information will be entered into the laboratory information system. Sample disposal will not occur until Wood confirms that all data have been fully validated and have provided written approval to permit sample disposal.

4.8 Field Storage and Transport Procedures

Samples will be collected, preserved and transported in accordance with the NJDEP FSPM and any method specific requirements. Samples will be transported to the laboratory on a daily basis. AA (laboratory) will be contacted to pick up the samples from the site at the end of each day.

Sample preservation requirements are included in Table 2. All samples will be stored in coolers and transported to the laboratory under COC, as previously described.

This project is not expected to generate samples that would be classified as dangerous goods or hazardous materials.

5.0 Analytical Laboratory Requirements

5.1 Project Compounds and Analytical Summary

The analytical methods to be used for this project includes:

- Metals (ICP) USEPA SW-846 6010C
- Pesticides USEPA SW-846 8081B
- PCB Aroclors USEPA SW-846 8082A
- Mercury SW-846 Method 7471B
- SVOCs by USEPA SW-846 8270D
- PCB Aroclors USEPA TO-10

Table 2 includes the sample matrix and applicable methods. The method detection limit (MDL) is dictated by the method and the laboratory reporting limit may vary depending on laboratory instruments and sample characteristics. These will be identified in the data deliverable package.

5.2 Analytical Quality Control

QA/QC requirements for the analyses to be performed are specified by the analytical methods. Analytical methods are provided in Table 2.

All laboratories utilized for this project are required to maintain NJDEP laboratory certification and to comply with QA/QC requirements for each method.

Required laboratory QC checks, their required frequency, the established control limits, and the actions to be taken if the control limits are exceeded are summarized for NJDEP and USEPA methods listed in Appendix C.

The laboratory QA/QC procedures are provided in the individual laboratory QA Manuals (QAMs). AA (laboratory) is certified by NJDEP for the methods it is utilizing.

5.3 Laboratory Deliverables

The laboratory deliverables for this project are dependent on the data generated and the requirements of the NJDEP TRSR. Reduced laboratory deliverables will be provided for all analyses performed under this project.

Electronic data will be provided by the laboratory in the required HAZSITE electronic data deliverable (EDD) format as required by the TRSR and as detailed in the NJDEP Electronic Data Interchange (EDI) Manual, dated February 2013.

6.0 Data Review and Usability

This section documents procedures for determining whether the results of the project may be used for the intended purpose. Data review and usability are important steps in a project as they apply to both field and lab activities. To accomplish this, all aspects of the project (e.g., field monitoring activities and laboratory analyses) will be examined to determine if any problems were encountered that might jeopardize the usability of the data.

This section of the QAPP addresses various data assessment issues performed by samplers, laboratory, and independent reviewers. It includes the criteria for accepting, rejecting, or qualifying data as discussed in the *Data Usability Assessment and Data Usability Evaluation Guidance Document*. (NJDEP, 2014d)

6.1 Data Management

Data acquired during this project include recording and transcribing field notes; logging and retrieval of field instrument data; transmittal of automated field and laboratory results; data transformation and reduction procedures; and data storage, retrieval and security issues throughout the project.

6.2 Data Verification and Usability

The laboratory data review process involves evaluation of both the results of the QC data and the professional judgment of the person(s) conducting the review. This application of technical knowledge and experience to the data evaluation is essential to ensuring the high quality of data. The laboratory has documented procedures, which are to be followed and must be accessible to all laboratory personnel. The laboratory generally reviews data in three steps before submittal:

- Level 1 Analyst/Peer Data Review – The analysts review the quality of their work based on an established set of guidelines. At a minimum, the review will ensure that appropriate preparation, analysis, and SOPs have been followed; analytical results are correct and complete; QC samples are within established control limits; and documentation is complete (for example, any anomalies have been documented).
- Level 2 Supervisory Data Review – A supervisor or data review specialist whose function is to provide independent review of the data package will perform this level of review. This review will also be conducted according to established guidelines (i.e., method requirements and laboratory SOPs). The Level 2 review includes review of the qualitative and quantitative data and of documented anomalies.
- Level 3 Administrative Data Review – A laboratory QA/QC officer or program administrator performs the final data review before submittal. This level of review provides a total overview of the data package to ensure its consistency and compliance with project requirements.

The project laboratory QA/QC officer or designee will evaluate the quality of the work based on this QAPP and an established set of laboratory guidelines to ensure the following:

- Sample preparation information is correct and complete.
- Analysis information is correct and complete.
- Appropriate procedures have been followed.
- Analytical results are correct and complete.
- Laboratory QC check results are within appropriate QC limits.
- Special sample preparation and analytical requirements have been met.
- Documentation is complete (all anomalies in the preparation and analysis have been documented; holding times are documented).

- Laboratory qualifiers have been assigned to all samples with data usability limitations.

6.3 Reconciliation with User Requirements

Examples of reconciling Data Quality Problems with Data Quality Goals	
Typical Data Verification and Validation Problems	Resulting Data Usability Assessment Issues
Matrix spike/matrix spike duplicate recoveries are below the acceptance criteria; there were unexpected matrix interferences.	Even with the low recoveries, did the data reveal enough information to be useful for decision-making?
Precision and bias criteria were not achieved. Initial calibration criteria (response factors, correlation coefficient) may not have been appropriate for these analytes.	Does a different method of analysis need to be used to obtain better quality data?
Some maximum allowable holding times have been exceeded. Thus, the results are either biased low or invalid.	Are the measured concentrations sufficiently above the action limits that the potential bias is not significant?
Because sample concentrations were higher than expected, the spike levels were not comparable with the unspiked concentrations, making the results essentially meaningless.	Are measured concentrations so far above the action limits that the low spike recoveries do not adversely affect the ability to confirm that the limits are exceeded?
Conditions in the field required that the sampling procedures be changed significantly.	Is there evidence to support the contention that the samples are still sufficiently representative?

7.0 Assessments

7.1 Performance and System Audits

Proper communication between field personnel, project management personnel, and laboratory personnel will help to ensure that the proper methods and techniques are used throughout the project.

The QC manager, or designee, will initiate audits, select the audit team, and oversee audit implementation.

The field manager will supervise and check that samples are collected and handled in accordance with this QAPP and that documentation of work is adequate and complete.

The laboratory QA manager will ensure that the analytical laboratory follows in-house performance guidelines and will perform system audits under the in-house QA/QC guidelines. The laboratory will immediately deal with any irregularities found in the laboratory's performance or system audits. The laboratory QA manager or their designee will also conduct the following internal audits regularly:

Technical audit, including reviews of calibration and equipment monitoring records, laboratory logbooks, maintenance records, and instrument control charts

Data quality audit reviews, including all aspects of data collection, reporting, and review

Management systems audits verifying that management and supervisory staff effectively implement and monitor all QC activities necessary to support the laboratory QA program.

The Wood project manager is responsible for overseeing that the project performance satisfies the QA objectives set forth in this document. Reports and technical correspondence will be peer reviewed by qualified individuals before being finalized.

7.2 Corrective Action Processes

Corrective actions include revising/updating the QAPP and adjusting field and/or laboratory procedures.

Audits and other assessments may find practices or procedures that do not conform to this QAPP. The following sections describe appropriate corrective actions for the various data management activities.

7.2.1 Field Corrective Action

The field manager will review the procedures being implemented in the field for consistency with the established protocols. Sample collection, preservation, labeling, etc., will be checked for completeness. Where procedures do not strictly comply with the established protocol, the deviations will be field documented and reported to the QA officer. Corrective actions will be defined and documented, as appropriate, by the Field Manager and reported to the Wood project manager and the QA officer. The documentation will become part of the project file.

7.2.2 Laboratory Corrective Action

The laboratory QA manager will be responsible for review of the data generated by their laboratory to ensure that all QC samples have been run as specified in the protocol. Recoveries of laboratory control sample (LCS), surrogate, and matrix spike (MS) samples will be reviewed for method accuracy. The RPD of laboratory duplicates and matrix spike duplicates (MSD) samples will be reviewed for method precision. The results will be evaluated against the control limits and appropriate corrective action taken if warranted.

Laboratory personnel will be alerted that corrective actions are necessary if any of the following occur:

- The QC data are outside the warning or acceptance limit(s) for precision and/or accuracy established for LCSs. The laboratory QA manager will consult the project chemist or the QC manager to discuss out-of-control data sets.
- Blanks contain contaminants at concentrations exceeding the detection limit.
- Undesirable trends are detected in the LCS or MS percent recoveries, RPDs, or surrogate recoveries.
- Unusual changes in detection limits are observed.
- The laboratory QA manager detects deficiencies during internal or external audits, or from the results of performance evaluation samples.

If the analyst identifies any nonconformity in the analytical methodologies or QC sample results, the laboratory will implement corrective actions immediately. Specific corrective actions are outlined in the laboratory QAM.

The analyst will review the preparation or extraction procedures for possible errors check the instrument calibration, evaluate spike and calibration mixes, check instrument sensitivity, and initially handle corrective action procedures at the bench level. The analyst will immediately notify his/her supervisor of the identified problem and the investigation that is being conducted. If the problem persists or cannot be identified, the matter will be referred to the laboratory supervisor and laboratory QA manager, and if the data are impacted, the project chemist and QC manager will be provided a corrective action memo for inclusion in the project file.

Corrective action may include, but will not be limited to:

- Reanalyzing suspect samples if holding time permits
- Retrieving the archived sample for analysis
- Accepting data with acknowledged level of uncertainty (with consultation)
- Recalibrating analytical instruments
- Evaluating and attempting to identify data limitations
- Re-sampling

Working with the project chemist, the QA officer will be responsible for reviewing the laboratory data generated for this project and ensuring that all project QA objectives are met. If any nonconformance is found in field procedures, sample collection procedures, field documentation procedures, laboratory analytical and documentation procedures, and data evaluation and quality review procedures, the impact of the nonconformance on the overall project QA objectives will be assessed. Appropriate actions, possibly including reanalysis or resampling, will be recommended to the Wood project manager so that the project objectives can be accomplished. Data deemed unacceptable by the Wood project manager, after the implementation of the required corrective actions, will not be accepted and further follow-up corrective actions will be explored.

8.0 Reporting, Documents and Records

8.1 Field Logbooks

Wood field staff will maintain a Site-specific field logbook for proper documentation of all Site activities.

Field logbooks must be bound and should have numbered, water resistant pages. All pertinent information regarding the Site and sampling procedures will be documented. Notations will be made in logbook fashion, noting the time and date of all entries. At a minimum, recorded information will include:

- Name and exact location of Site
- Date and time of arrival and departure
- Affiliation of persons contacted
- Name of person keeping log
- Names of all persons on the Site
- Purpose of visit
- Relevant Site information (processes or products, waste generation, nature of spilled material)
- Composition and concentration of substance, if known; description of sampling plan
- Field instrument calibration information
- Location of sampling points (including justification)
- Geographically referenced location of sample point
- Number of samples collected with volumes
- Preservation
- Method of sample collection and any factors that may affect its quality
- Date and time of sample collection and any factors that may affect its quality
- Name of collector
- All sample identification numbers
- Description of samples
- Weather conditions on the day of sampling and up to 48 hours previous and any field observations

8.1.1 Documenting Sampling Points

Sampling points will be documented for their exact location for purposes of future sampling. It is also necessary to document sample locations in an approved geographically referenced format per NJDEP Site Remediation Program EDI requirements when submitting analytical results for those samples.

Documentation of sample locations for field notes can be accomplished through the use of a monument, measuring tape and compass. A monument should be chosen at each Site to act as a stationary reference point from which all sampling points can be measured using a compass and measuring tape.

When establishing a sampling point, follow this procedure:

1. Standing at the monument, facing sampling point, use the compass hairlines to determine degree of direction.

2. Line of sight should run from the monument, through both hairline needles on the compass, to the sampling point.
3. When first establishing the sampling point, record the degree and direction reading from the compass in the field notebook, along with the distance measurement, from the monument to the exact sampling point.

8.1.2 Photo-Documentation

To the extent practicable, all sampling points should be documented on digital media (e.g., digital camera or cell phone). Photographs taken to document sampling points should include two or more reference points to facilitate relocating the point at a later date. Keeping a record of photographs taken is required. For each photograph taken, several items should be noted in the field notebook:

- Date
- Time
- Photographed by (name)
- Name of Site
- General direction faced and description of the subject taken
- Sequential number of the photograph

8.2 Records Management

Documents and records will be generated by Wood and laboratory personnel. Wood documentation includes:

- Field notes that document sample collection and handling, equipment calibration records, and daily notes that could impact quality of the data being generated; and
- Assessment reports; and data reconciliation results and associated recommendations that are developed through the review of the laboratory deliverable packages.

Laboratory documentation includes sample collection and handling records; analytical logbooks; QC sample records; equipment calibration records; assessment reports; and data reconciliation results and associated recommendations. The pertinent information is provided to Wood in the laboratory deliverable.

All project data is maintained in project files. Electronic files are maintained on the Wood secure server, which is regularly backed up to ensure data is recoverable, if necessary.

Instructions

Instrument Identification and Source: Record identification number fixed to instrument. If no identification number is clearly visible, record serial number and indicate with "S/N". Identify source of equipment (i.e. "AMEC" or name of company from which the device was rented) and for PID the size of the lamp. To avoid repetition, it is permissible to reference a previous log by specific date. However, it is recommended that each monitor be tagged with a project-specific instrument number (i.e. "P1").

Source: Identify source of instrument (i.e. "AMEC" or identify company from which the device was rented)

Lamp: Indicate power of infrared lamp in PID (i.e. 10.7 eV or 11.8 eV)

Field Team: Provide full names of all AMEC personnel in the work area and any other persons who might record data along

Recorded By: Initials of person taking reading. An entry of " " is permissible to indicate same as above

Location: Identify work location, for example "North Station". An entry of " " is permissible to indicate same as above

Time: Record readings approximately every 30 minutes. Use military time, i.e. 20:00, not 8:00 pm

Dir.: Indicate prevailing wind direction during sampling activities. Any change in wind direction during sampling should be noted in Comments and Observations section.

Speed: Indicate qualitative wind speed: "No Wind" "Slight" "Moderate" or "Strong"

Inst. No. Identify the instrument being used based on Instrument Identification and Source (i.e. "P1" is the first PID on the list)

Work Zone: Record instrument readings in worker breathing zone, approximately 5 feet above ground level at location of worker nearest potential source area

Downwind: Record instrument readings in breathing zone at downwind boundary of Exclusion Zone

Other: Record readings from other locations (if monitored), such as site background, upwind boundary of Exclusion Zone and/or distance and direction outside Exclusion Zone. Describe location under comments and observations section.

Comments and Observations: Record pertinent comments including instrument performance, changes in background and identification of potential sources.

wood.

Appendix C

**Table 2 QAPP Worksheet All Matrices – Metals (ICP) USEPA SW-846 6010C
Measurement Performance Criteria & QC Samples**

Data Quality Indicator (DQI)	QC Measure for Sampling (S), Analytical (A), or both (S&A)	QC Sample or Activity	Frequency / Number	QC Acceptance Limits (Measurement Performance Criteria)	Corrective Action (CA)	Person(s) Responsible for CA
Accuracy	A	Linear Dynamic Range (LDR)	At a minimum the LDR should be check every 6 months	A minimum of 3 different concentration standards across the ICP range one should be near the upper limit of the range.	NA	Analyst
Accuracy	A	Initial Calibration	Daily prior to sample analysis	Minimum of a calibration blank plus a standard per manufacturing recommended procedures; RL standard may be included in multi-point calibration curve; linear curve fit with correlation coefficient ≥ 0.998 .	Re-optimize instrument and re-calibrate, repeat until successful	Analyst
Accuracy	A	Initial Calibration Verification (ICV)	Daily after calibration	Separate-source from calibration standards; must contain all target analytes ICV: 90-110% recovery	Re-analyze; if still out, Re-calibrate as required by method; suspend all analysis until ICV meets criteria	Analyst
Sensitivity	A	Low Level Initial Calibration Verification	For method 6010C, LLICV must be analyzed at the beginning of the run before any samples and at the end of the run.	Same source as calibration standards; must contain all target analytes at the RL 70-130% recovery	Re-analyze. If still out, Re-calibrate/re-analyze. Suspend all analyses until LLICV meets criteria unless all results > 10x RL	Analyst

**Table 2 QAPP Worksheet All Matrices – Metals (ICP) USEPA SW-846 6010C
Measurement Performance Criteria & QC Samples**

Data Quality Indicator (DQI)	QC Measure for Sampling (S), Analytical (A), or both (S&A)	QC Sample or Activity	Frequency / Number	QC Acceptance Limits (Measurement Performance Criteria)	Corrective Action (CA)	Person(s) Responsible for CA
Accuracy	A	Initial Calibration Blanks (ICB)	After ICV	Must be matrix-matched (and same conc. of acid found in standards and samples); ICB: < ± RL	Re-analyze ; if still out, Re-calibrate and reanalyze.	Analyst
Accuracy	A	Continuing Calibration Verification (CCV)	1 every 10 samples and at end of run	Same source as calibration standards; conc. near mid-point of calibration curve; must contain all target analytes CCV: 90 - 110% recovery	Re-analyze; if still out, Re-calibrate and reanalyze. All samples since last acceptable CCV	Analyst
Sensitivity	A	Low Level Continuing Calibration Verification	For method 6010C, LLCCV must be analyzed at the beginning of the run before any samples and at the end of the run.	Same source as initial calibration standards; must contain all target analytes at the RL 70-130% recovery	Re-analyze. If still out, Re-calibrate/re-analyze. Suspend all analyses until LLICV meets criteria unless all results > 10x RL	Analyst
Sensitivity	A	Continuing Calibration Blanks (CCB)	After each CCV	Must be matrix-matched (and same conc. of acid found in standards and samples); CCB: < ± RL	Re-analyze ; if still out, Re-calibrate and reanalyze.	Analyst
Accuracy & Sensitivity (Contamination)	A	Method Blank (MB)	1 per digestion batch - not to exceed 20 field samples	Must be digested with samples using same preparation method and amount of acids; MB: < RL	Re-analyze; if still out redigest & re-analyze all samples unless all detected results > 10x MB level	Analyst

**Table 2 QAPP Worksheet All Matrices – Metals (ICP) USEPA SW-846 6010C
Measurement Performance Criteria & QC Samples**

Data Quality Indicator (DQI)	QC Measure for Sampling (S), Analytical (A), or both (S&A)	QC Sample or Activity	Frequency / Number	QC Acceptance Limits (Measurement Performance Criteria)	Corrective Action (CA)	Person(s) Responsible for CA
Accuracy	A	Interference Check Standards (ICSA and ICSAB)	Daily after calibration	ICSA & ICSB: 80-120% recovery ICSA: non-spiked analytes $\leq 2x$ RL	Re-analyze; if still out, adjust interference and background correction, and/or linear ranges as needed & recalibrate and reanalyze all field samples since last complaint ICSA & ICSB	Analyst/Data Reviewer
Accuracy	A	Laboratory Control Sample (LCS)	1 per digestion batch - not to exceed 20 field samples	Must contain all target analytes and be matrix-specific; Aq. LCS: 80-120% recovery; Soil/Sediment/sol-id LCS: vendor control limits (95% confidence limits)	Re-analyze, if still out' redigest & Re-analyze LCS & all field samples in batch	Analyst/Data Reviewer
Precision	A	Sample Duplicate (DUP)	1 per ≤ 20 field samples if an MS/MSD was not performed	Must be performed on a Site field sample. For soil and aqueous samples: Results $\geq 5xRL$, RPD $\leq 20\%$ aqueous, 35% solids; Results $< 5xRL$: absolute difference between results $\leq RL$.	Re-analyze, qualify data	Analyst/Data Reviewer
Accuracy	S & A	Matrix Spike (MS) [Site-specific QC]	1 per ≤ 20 field samples	Must be performed on a Site field sample; MS: 75-125% recovery; professional judgment if sample concentration $> 4x$ spike level	Evaluate LCS, unspiked sample and qualify data	Analyst/Data Reviewer
Precision	S & A	Matrix Spike Duplicate (MSD) [Site-specific QC]	1 per ≤ 20 field samples	Must be performed on a Site field sample. For soil and aqueous samples: Results $\geq 5xRL$, RPD $\leq 20\%$ aqueous, 35% solids; Results $< 5xRL$: absolute difference between results $\leq RL$.	Lab narrates outlier; qualify data	Analyst/Data Reviewer

**Table 2 QAPP Worksheet All Matrices – Metals (ICP) USEPA SW-846 6010C
Measurement Performance Criteria & QC Samples**

Data Quality Indicator (DQI)	QC Measure for Sampling (S), Analytical (A), or both (S&A)	QC Sample or Activity	Frequency / Number	QC Acceptance Limits (Measurement Performance Criteria)	Corrective Action (CA)	Person(s) Responsible for CA
Accuracy	A	Post digestion spike	1 per ≤ 20 field samples if less than acceptable accuracy and precision data are generated	Should be performed if MS/MSD recoveries were unacceptable: 80-120% recovery	Lab narrates outlier; qualify data	Analyst/Data Reviewer
Accuracy	A	Serial Dilution	1 per ≤ 20 field samples if less than acceptable accuracy and precision data are generated	Perform 5x dilution on same sample used for MS % Difference ≤ 10% for results >10x RL.	Lab narrates outlier qualify data	Analyst/Data Reviewer
Accuracy	A	Quantitation	Not applicable	RL ≤ results ≤ linear calibration range on a sample-specific basis. Report all Aq. results in µg/L or mg/L and all Soil/Sediment results in mg/Kg on a dry-weight basis.	Perform dilution to bring analyte within linear range; report from diluted analysis	Analyst/Data Reviewer
Overall Precision & Representativeness	S & A	Field Duplicate Sample [Site-specific QC]	1 per 20 field samples	Aq.: Results ≥ 5xRL: RPD ≤ 30%; Results < 5xRL: professional judgment; Soil/Sediment: Results ≥ 5xRL: RPD ≤ 50%; Results < 5xRL: professional judgment	Potential data usability issue; indication of sample heterogeneity	Data Reviewer
Accuracy (preservation)	S & A	Sample preservation	every field sample	Aq.: Total Metals: HNO ₃ pH < 2; (Dissolved Metals: filter on site or at the lab then HNO ₃ pH < 2 but cannot be used for regulatory compliance) Soil/Sediment: collect unpreserved per SW-846 Chapter 3 Table 3-2	Lab narrates outlier. Potential data usability issue	Data Reviewer
Data Completeness	S & A	Calculate from valid/usable data collected	Not applicable	Minimum ≥ 90% Overall	Potential data usability / data gap issue	Data Reviewer/ Investigator

**Table 2 QAPP Worksheet All Matrices – Metals (ICP) USEPA SW-846 6010C
Measurement Performance Criteria & QC Samples**

Data Quality Indicator (DQI)	QC Measure for Sampling (S), Analytical (A), or both (S&A)	QC Sample or Activity	Frequency / Number	QC Acceptance Limits (Measurement Performance Criteria)	Corrective Action (CA)	Person(s) Responsible for CA
Accuracy/ Sensitivity	S & A	Holding Time (HT)	every field sample	For aqueous and soil samples six months. If Soil/Sediment samples are frozen, HT arrested and HT begins when thawed. Samples can be maintained frozen for 1 year from collection.	Lab narrates outlier. Potential data usability issue	Data Reviewer
Accuracy & Sensitivity (Contamination)	S & A	Equipment Rinsate Blank (EB)	Not Required if using dedicated sampling equipment. If performing decontamination of equipment, collect 1 EB per 20 field samples collected by the same method	Aqueous EB: < RL Soil/Sediment EB <RL on solid equivalent basis	Aqueous Potential data usability issue, Soil/Sediment: non-matrix matched aqueous EB use professional judgment	Data Reviewer
Comparability	S & A	Based on Method (SOP) and QAPP/FSP protocols	Not applicable	Comparison between historical data for qualitative integrity of the data. Comparison between spatially similar samples.	Potential data usability issue	Data Reviewer/ Investigator

NOTES:

**Table 5 QAPP Worksheet All Matrices - Pesticides USEPA SW-846 8081A & B
Measurement Performance Criteria & QC Samples**

Data Quality Indicator (DQI)	QC Measure for Sampling (S), Analytical (A), or both (S&A)	QC Sample or Activity	Frequency / Number	QC Acceptance Limits (Measurement Performance Criteria)	Corrective Action (CA)	Person(s) Responsible for CA
Accuracy/ Sensitivity	A	Method Blank	1 per extraction batch of up to 20 field samples (matrix-specific)	All Target compounds < RL, surrogates in criteria	Reanalyze and, if necessary, re-extract. Report non-conformance in narrative; compounds present in blank should be flagged "B" in samples, if detected.	Analyst
Accuracy	A	Matrix Spike/ Matrix Spike Duplicate [Site-specific QC]	1 per ≤ 20 field samples	Must contain all single-component target analytes, performed on Site field sample; 30-150% recovery for all compounds.	Evaluate LCS, unspiked sample, reanalyze, if necessary, and qualify data and narrate issue	Analyst/Data Reviewer
Precision	A	Matrix Spike/ Matrix Spike Duplicate [Site-specific QC]	1 per ≤ 20 field samples	Must contain all single-component target analytes, performed on Site field sample; 30-150% recovery for all compounds; RPD ≤ 30% for solids and RPD ≤ 20% for waters	Reanalyze, if necessary, qualify data and narrate issues of non-conformance	Analyst/Data Reviewer
Accuracy	A	Laboratory Control Sample (LCS)	1 per extraction batch of up to 20 samples	Must contain all single-component target analytes, concentration should be the same as MS if appropriate, be matrix-matched, 40-140% recovery for all target analytes.	Reanalyze, if necessary, qualify data and narrate issues of non-conformance	Analyst/Data Reviewer
Precision	A	Sample Duplicate (DUP)	1 per ≤ 20 field samples if an MS/MSD was not performed	Must be performed on a site sample, RPD ≤ 30% for solids and RPD ≤ 20% for waters for results > 2x RL	Reanalyze, if necessary, qualify data and narrate issues of non-conformance	Analyst/Data Reviewer
Accuracy	A	Surrogates	Every sample including QC	Minimum of 2 (recommend TCMX and DCB); 30-150% recovery on both GC columns	Reanalyze, if necessary, qualify data	Analyst/Data Reviewer

**Table 5 QAPP Worksheet All Matrices - Pesticides USEPA SW-846 8081A & B
Measurement Performance Criteria & QC Samples**

Data Quality Indicator (DQI)	QC Measure for Sampling (S), Analytical (A), or both (S&A)	QC Sample or Activity	Frequency / Number	QC Acceptance Limits (Measurement Performance Criteria)	Corrective Action (CA)	Person(s) Responsible for CA
Accuracy	A	Internal Standards (IS) (optional)	Every sample including QC (optional)	Minimum of 1 IS , Areas 50-200% of CCV; RTs \pm 30 sec from ICAL	Reanalyze and qualify data	Analyst/Data Reviewer
Accuracy	A	Endrin/DDT Breakdown	Before samples are analyzed and at the beginning of each 12 hour shift	% Breakdown \leq 15% based on peak areas	Perform instrument maintenance; reanalyze until acceptable	Analyst
Accuracy	A	Initial Calibration (ICAL)	Initially and when CCV fails	Minimum 5-levels for single-component analytes and single-level for multi-component analytes using peak height or peak area; must contain all targets and lowest level \leq RL; %RSD \leq 20% or "r" \geq 0.99 for all compounds; regression analysis, if used, must not be forced through the origin	Recalibrate as required by method; analysis cannot proceed without a valid initial calibration	Analyst
Accuracy	A	Continuing Calibration Verification(CCV)	Prior to samples, every 12 hours or every 20 samples, whichever is more frequent, and at the end of the analytical sequence	Concentration level near mid-point of ICAL curve containing all single-component target compounds; %D \leq 20% and analytes fall within expected retention time windows; Multi-component analytes must be verified within 12 hours of being detected in a sample	Recalibrate as required by method; note outliers in narrative.	Analyst

**Table 9 QAPP Worksheet All Matrices - Mercury SW-846 Method 7471B and 7470A
Measurement Performance Criteria & QC Samples Table– Mercury**

Data Quality Indicator (DQI)	QC Measure for Sampling (S), Analytical (A), or both (S&A)	QC Sample or Activity	Frequency / Number	QC Acceptance Limits (Measurement Performance Criteria)	Corrective Action (CA)	Person(s) Responsible for CA
Accuracy	A	Initial Calibration	Daily prior to sample analysis	Minimum of 5 calibration levels plus blank; low level standard at level of RL; linear regression with a correlation coefficient $r \geq 0.995$	Re-optimize instrument and re-calibrate, repeat until successful	Analyst
Accuracy	A	Initial Calibration/ Initial Calibration Verification (ICV)	Daily after calibration	Separate-source from calibration standards; ICV: 90-110% recovery	Re-analyze; if still out, Re-calibrate as required by method; suspend all analysis until ICV meets criteria	Analyst
Accuracy	A	Continuing Calibration Verification (CCV)	1 of every 10 samples and at end of run	Same source as calibration standards; conc. near mid-point of calibration curve; CCV: -80 - 120% recovery	Re-analyze and, if still out, Re-calibrate and Re-analyze all samples since last acceptable CCV	Analyst
Sensitivity	A	Initial and Continuing Calibration Blanks (ICB and CCB)	After ICV and after each CCV	Must be matrix-matched (and same conc. of acid found in standards and samples); CCB: $< \pm RL$	Re-analyze; if still out, Re-calibrate, reanalyze.	Analyst
Sensitivity	A	Low Level Calibration Check Standard	Daily only if RL standard is not included in initial calibration	Low Level Check Standard: 70-130% recovery	Recalibrate/reanalyze unless all results $> 10x RL$	Analyst
Accuracy & Sensitivity (Contamination)	A	Method Blank (MB)	1 per digestion batch - not to exceed 20 field samples	Must be digested with samples using same preparation method and amount of acids; MB: $< RL$	Re-analyze; if still out redigest & re-analyze all samples unless all detected results $> 10x MB$ level	Analyst

**Table 9 QAPP Worksheet All Matrices - Mercury SW-846 Method 7471B and 7470A
Measurement Performance Criteria & QC Samples Table– Mercury**

Data Quality Indicator (DQI)	QC Measure for Sampling (S), Analytical (A), or both (S&A)	QC Sample or Activity	Frequency / Number	QC Acceptance Limits (Measurement Performance Criteria)	Corrective Action (CA)	Person(s) Responsible for CA
Accuracy	A	Laboratory Control Sample (LCS)	1 per digestion batch - not to exceed 20 field samples	Must be matrix-specific; aqueous LCS: 80-120% recovery; Soil/Sediment LCS vendor control limits (95% confidence)	Re-analyze, if still out; redigest (soil/sed.) & Re-analyze LCS & all field samples in batch	Analyst/ Data Reviewer
Precision	A	Sample Duplicate (DUP)	1 per ≤ 20 field samples if an MS/MSD was not performed	Must be performed on a Site field sample. Aq.: Results RPD ≤ 20%; Soil/Sediment: Results, RPD ≤ 35%;	Re-analyze, qualify data	Analyst/ Data Reviewer
Accuracy	S & A	Matrix Spike (MS) [Site-specific QC]	1 per ≤ 20 field samples	Must be performed on a Site field sample; MS: 75-125% recovery; professional judgment if sample concentration > 4x spike level	Evaluate LCS, unspiked sample, re-analyze, if necessary, and qualify data	Analyst/ Data Reviewer
Precision	S & A	Matrix Spike Duplicate (MSD) [Site-specific QC]	1 per ≤ 20 field samples	Must be performed on a Site field sample Aq.: Results ≥ 5xRL, RPD ≤ 20%; Results < 5xRL: absolute difference between results ≤ RL. Soil/Sediment: Results ≥ 5xRL, RPD ≤ 35%; Results < 5xRL: absolute difference between results ≤ 2xRL	Lab narrates outlier; Re-analyze, qualify data	Analyst/ Data Reviewer
Accuracy	A	Quantitation	Not applicable	RL ≤ results ≤ upper calibration range on a sample-specific basis. Report all Aq. results in µg/L or mg/L and all Soil/Sediment results in mg/Kg on a dry-weight basis.	Perform dilution to bring analyte within linear range, report from diluted analysis	Analyst/ Data Reviewer
Overall Precision & Representativeness	S & A	Field Duplicate Samples [Site-specific QC]	1 per 20 field samples	Aq.: Results ≥ 5xRL: RPD ≤ 30%; Results < 5xRL: professional judgment; Soil/Sediment: Results ≥ 5xRL: RPD ≤ 50%; Results < 5xRL: professional judgment	Potential data usability issue; indication of sample heterogeneity	Data Reviewer

Comparability	S & A	Based on Method (SOP) and QAPP/FSP protocols	Not applicable	Comparison between historical data for qualitative integrity of the data. Comparison between spatially similar samples.	Potential data usability issue	Data Reviewer/ Investigator

NOTES:

1. This table was prepared by NJDEP, January 2011 to be compliant with EPA Region 2 guidance and meet the data quality needs of the Department.

2. Semivolatile Organic Compound analyses via USEPA SW-846 Method 8270D (*Quality Assurance and Quality Control Requirements for SW-846 Method 8270D Semivolatile Organic Compounds by Gas Chromatography/Mass Spectroscopy [GC/MS]*). 8270D:

** Potentially “difficult” analytes include: Benzenethiol, Benzoic Acid, 2,4-Dinitrophenol, 3&4 – Methylphenol, 4-Nitrophenol, Pentachlorophenol, Phenol, Aniline, Aramite, A,A-Dimethylphenethylamine, Benzidine, Benzaldehyde, Benzyl Alcohol, Caprolactam, Chlorobenzilate, 3,3'-Dimethylbenzidine, 1,4-Dioxane, 7,12-Dimethylbenz(a)anthracene, Diallylate, Dibenz(a,j)acridine, Diphenylamine, Disulfoton, p-(dimethylamine)azobenzene, Decane, Famphur, Hexachlorocyclopentadiene, Hexachloroethane, Hexachlorophene, Hexachloropropene, Kepone, 4,4'-methylenebis(2-chloroaniline), Methapyrilene, Methyl methanesulfonate, Methyl parathion, n-Nitrosodimethylamine, 4-Nitroquinoline-1-oxide, 2-Picoline, Parathion, Pentachloroethane, Pentachlorobenzene, Pentachloronitrobenzene, Phorate, Pronamide, Pyridine, p-Phenylenediamine, o-tricresyl phosphate and Tetraethyl. Please note that many of the surrogates fall outside or the 15 – 110% range 2-Fluorophenol, Phenol-d5, 2,4,6-Tribromophenol and Terphenyl-d14.

Determination of Polychlorinated Biphenyls (PCBs) as Aroclors by Gas Chromatography/Electron Capture Detection (GC/ECD)

References: Method 8082A, Rev. 1, February 2007 and Method 8000C Test Methods for Evaluating Solid Waste, SW-846, Third Edition, Final update III, December 1996 (USEPA, Office of Solid Waste and Emergency Response, Washington, DC).

Quality Assurance and Quality Control for SW-846 Method 8082, Polychlorinated Biphenyls (PCBs) by Gas Chromatography (GC) for the Massachusetts Contingency Plan (MCP)

State of Connecticut, Department of Environmental Protection, RRCP, Version 2.0, July 2006.

Compendium Method TO10A – Determination of Pesticides and PCBs in Ambient Air Using Low Volume Polyurethane Foam (PUF) Sampling Followed by GC/ECD Detection

Compendium Method TO-4A – Determination of Pesticides and PCB's in Ambient Air Using High Volume Polyurethane Foam (PUF) Sampling Followed by Gas Chromatographic/Multi-Detector Detection (GC/MD)

1. Scope and Application

Matrices: Water, soil, sediment, sludge, product, PUF, and tissue (either animal or vegetable)

Definitions: Refer to Alpha Analytical Quality Manual.

This method is applicable to the analysis and quantification of sample extracts for Polychlorinated Biphenyls (PCB) Aroclors as Total PCB by gas chromatography/electron capture detector. See Table I for the target compound list of PCB as Aroclors with associated CAS Registry Numbers.

The sensitivity of the method usually depends on the concentration of interferences rather than on instrumental limitations. If interferences prevent detection of the analytes, the method may also be performed on samples that have undergone cleanup.

The following extraction and cleanup methods may apply, prior to sample analysis:

- *Extraction of Water Samples by Separatory Funnel* (2156),
- *Microscale Solvent Extraction - 3570* (2172)
- *Soxhlet Extraction* (2173)
- *Soxhlet Extraction of PUFs* (2167)
- *Tissue Preparation and Homogenization* (2166),
- *Shaker Table Extraction* (2261),
- *Sulfur Cleanup* (2168),
- *Sulfuric Acid Cleanup* (2169),
- *Silica Gel cleanup* (2170)
- *GPC Cleanup by HPLC* (2167)

The data report packages present the documentation of any method modification related to the samples tested. Depending upon the nature of the modification and the extent of intended use, the laboratory may be required to demonstrate that the modifications will produce equivalent results for the matrix. Approval of all method modifications is by one or more of the following laboratory personnel before performing the modification: Area Supervisor, Department Supervisor, Laboratory Director, or Quality Assurance Officer.

This method is restricted to use by or under the supervision of analysts experienced in the operation of the GC-ECD and in the interpretation of GC-ECD data. Each analyst must demonstrate the ability to generate acceptable results with this method by performing an initial demonstration of capability.

2. Summary of Method

Sample extracts are analyzed on a gas chromatograph which is fitted with two capillary columns of differing polarities each employing separate detectors. The extracts are spiked with internal standard prior to analysis. The target analytes are resolved on each column and detected using an electron capture detector (ECD). Analytes are introduced into the GC/ECD by injecting a known volume of the calibration standards, quality control samples, and sample extracts into the GC which is temperature and flow programmed to separate the analytes. Identification of target analytes is accomplished by confirming a target hit on two dissimilar columns using Retention Time (RT) and Pattern Recognition (PR). Concentrations are calculated from the ECD response using internal standard techniques. Concentrations are determined using mean Relative Response Factor derived from multi-level calibration curve.

2.1 Method Modifications from Reference

Internal standard calibration is used. The internal standard used is 1-bromo-2- nitrobenzene.

3. Reporting Limits

The Reporting Limit for aqueous samples is 0.02 ug/L for individual Aroclors. This value is based on a 1mL final volume and 500 or 1000 mL of environmental sample extracted. The Reporting Limit for solid/tissue samples is 2.5ug/kg and 15 ug/Kg for individual Aroclors. This value is based on 2 mL final volume and 10-30 grams of environmental sample extracted (wet weight) using extraction method 3570 (MSE). The reporting limit for Aroclors in PUF air samples is 20-100ng/PUF cartridge, based on the Soxhlet extraction of one low or high volume PUF and a final volume of 1mL. Detection limits will vary with the individual sample matrix, sample preparation procedures, instrument calibration range, and volume of sample analyzed.

4. Interferences

4.1 Instrumental

- 4.1.1 Only high purity gases are used in the GC system to eliminate this source of possible contamination. Both Hydrogen (carrier gas) and Nitrogen (detector make-up gas) are certified by the gas supplier.
- 4.1.2 Preventive instrument maintenance is performed routinely, and whenever highly contaminated extracts are analyzed that could result in chromatographic interferences or result in degradation of system performance.
- 4.1.3 Glassware must be scrupulously cleaned. This procedure is detailed in the Laboratory Glassware cleaning SOP/1753. Store dry glassware in a clean environment.

4.2 Parameters

- 4.2.1 Contaminants co-extracted from the sample may cause matrix interferences. The extent of matrix interferences will vary considerably from sample to sample, depending upon the nature of the environment and matrix being investigated. In some cases depending on the severity of the observed interferences, a target hit on one column may be biased high when interfered with. Skilled analyst judgment is imperative in determining if a chromatographic peak appears interfered. In these cases the non-interfered, non-biased hit can be forced for reporting purposes providing a more suitable value. In extreme cases of interference

additional cleanups can be employed, or it may be necessary to analytically re-run the sample at a dilution.

- 4.2.2 The ECD is theoretically a halogen specific detector. However, phthalate esters can be a major source of contamination in that they do respond to the ECD and can interfere with accurate determination of the analytes of interest. No forms of plastic or any material containing plasticizers (phthalates) should be used in conjunction with any part of this analysis.
- 4.2.3 Elemental sulfur is readily extracted from soil samples and may cause chromatographic interferences in the determination of pesticides. Sulfur can be removed through the use of Method 3660B. In addition, all samples for PCB analysis are acid cleaned following Method 3665A. Associated SOPs are noted in Section 1.0, above.
- 4.2.4 Care must be taken to ensure a complete hexane exchange is performed on the extract, because residual methylene chloride would be an interferent in the analysis. Residual methylene chloride can also damage the electron capture detectors.
- 4.2.5 The injector system of the gas chromatograph can become contaminated with non-volatile components from samples. This can act to decrease the resolution and responsiveness of the system. Maintenance of the analytical system should be performed when system performance degrades (liner changes, injection port cleaning, etc.) to avoid prolonged down time.
- 4.2.6 Aldol condensation products (4-methyl-4-hydroxy-2-pentanone and 4-methyl-3-pentene-2-one) can arise during soil extraction when using methylene chloride:acetone. These products may interfere with detection of analytes and should be monitored.
- 4.2.7 Raw GC data from all blanks, samples, and spikes must be evaluated for interferences or carryover. Contamination by carryover can occur whenever high-concentration and low-concentration samples are sequentially analyzed.
- 4.2.8 Per method 8082A each analytical column analyzing PCB's must be evaluated for the presence of coelutions amongst PCB congeners with pesticides. An aliquot of PCB pesticide LCS solution is prepared and analyzed routinely on each analytical column in the laboratory. The subsequent coelutions of these compounds are documented and stored internally in the "ECD Standard Verification Logbook" within the facility.

5. Health and Safety

The toxicity or carcinogenicity of each reagent and standard used in this method is not fully established; however, each chemical compound must be treated as a potential health hazard. From this viewpoint, exposure to these chemicals must be reduced to the lowest possible level by whatever means available. A reference file of material data handling sheets is available to all personnel involved in the chemical analysis. PCBs have been tentatively classified as known or suspected human or mammalian carcinogens. Additional references to laboratory safety are available in the Chemical Hygiene Plan. All personnel handling environmental samples known to contain or to have been in contact with municipal waste must follow safety practices for handling known disease causative agents.

- 5.1 Lab coats, safety glasses, and gloves must be worn when handling samples, extracts, standards or solvents.
- 5.2 All solvent and extract transfers must be handled in the vented bench area in the GC laboratory.

- 5.3 All stock standards, working standards, and vialled sample extracts must be placed into the waste bucket in the lab, for future disposal by the Hazardous Waste Manager. The container must be labeled properly with hazard warning labels indicating the container contents.
- 5.4 Bottles containing flammable solvents must be stored in the flammables cabinet.

6. Sample Collection, Preservation, Shipping and Handling

6.1 Sample Collection

Aqueous samples are collected in 500mL, 1L amber glass bottles and stored without preservative at 4°C

Soil/sediment/tissue samples are collected in 4-8oz. glass soil jars.

Air PUF samples are collected following the guidance in reference method TO-10A and TO-4A Compendium.

6.2 Sample Preservation

Aqueous and Air PUF samples are stored without preservative at 4°C

Tissue Samples are stored at 4°C, or if desired, frozen.

Soil/sediment samples are stored at 4°C, or if desired, frozen.

6.3 Sample Handling

The hold time for this method is 7 days for the extraction of aqueous and Air PUF samples, and 14 days for the extraction of solid and tissue samples. If a sediment or tissue samples are frozen, this suspends the holding time until removal from the freezer. All extracts must be analyzed within 40 days of the extraction date.

7. Equipment and Supplies

7.1 Gas Chromatograph, Agilent 6890, 7890: An analytical system complete with gas chromatograph configured for split-splitless injection and all required accessories including syringes, analytical columns, gases, electron capture detectors (ECD), and data system.

7.2 GC Columns: Alpha utilizes dual-column analyses. The dual-column approach involves either a single injection that is split between two columns that are mounted in a single gas chromatograph. Typical column pair used is listed below. Other columns may be used as long as method performance criteria can be met.

7.2.1 Column pair:

RTX-CLP: Cat. #11141 from Restek or equivalent; 30m, 0.32mm, 0.32µm

RTX-CLPII Cat. #11324 from Restek or equivalent; 30m, 0.32mm, 0.25µm

7.3 Guard Column:

Cat. #10027 from Restek or equivalent; 5m, 0.32mm

7.4 Class "A" Volumetric Flasks: 10mL and 25mL, for standards preparation

7.5 Syringes: 10 µL – 1000 µL

7.6 Gooseneck splitless injecton liner, Cat #20799-214.5 from Restek or equivalent

7.7 Universal "Y" Press-tight tee split: Cat. #20406 from Restek or equivalent

- 7.7 Autosampler:** Adapted onto the Gas Chromatograph. Model is HP 7890 or 6890 series autosampler with a GC autosampler controller.
- 7.8 Computer:** With Windows NT operating software utilizing HP Enviroquant G1701BA Version B.01.00 software.
- 7.9 Gases:** Hydrogen, ultra high purity grade and Nitrogen of equivalent purity. Hydrogen is generally supplied by a Proton Hogen GC 600 Hydrogen generator.
- 7.10 Glassware:** Assorted Class-A volumetric flasks consisting of 5mL through 200mL flasks with ground-glass stoppers for preparing reagents, standards, and measuring sample volumes for sample requiring dilution beyond 1:100.
- 7.11 Pipettes:** Disposable Pasteur brand, or equivalent.
- 7.12 Cahn balance:** Capable of accurate measurement to the nearest 0.001 mg.
- 7.13 Analytical balance:** Capable of accurate measurement to the nearest 0.0001 g.
- 7.14 Non-preserved, certified, pre-cleaned 40mL VOA vials,** with Teflon-lined screw caps.
- 7.15 2 mL amber and clear GC vials,** with Teflon-lined crew caps.
- 7.16 Stainless steel Spatula.**

8. Reagents and Standards

- 8.1 Solvents:** All solvent expirations determined as indicated by manufacturer guidelines.
- 8.1.1 Methylene Chloride,** ACS approved, Pesticide grade, see SOP *Reagent, Solvent, and Standard Control* (1816) for additional details regarding solvent purity.
- 8.1.2 Acetone,** ACS approved, Pesticide grade, see SOP *Reagent, Solvent, and Standard Control* (1816) for additional details regarding solvent purity.
- 8.1.3 Hexane,** ACS approved, Pesticide grade, see SOP *Reagent, Solvent, and Standard Control* (1816) for additional details regarding solvent purity.
- 8.1.4 Methanol,** Purge and Trap grade, see SOP *Reagent, Solvent, and Standard Control* (1816) for additional details regarding solvent purity.
- 8.1.5 Diethyl ether,** High purity, glass distilled
- 8.2 Primary Standard Solutions:** All Primary standard solutions are purchased from commercial vendors as flame sealed ampule certified solutions. When a flame sealed ampule primary solution is opened, it is transferred to a labeled amber 2mL vial.
- Primary Standards are stored as indicated by the vendor, away from light when not in use. Primary standards are discarded as indicated by the vendor expiration. If breakdown of a solution is observed, the solution will be discarded.
- 8.2.1 Aroclor 1016 Solution:** Obtained from Accustandard at a concentration of 100ug/mL (catalog # C-216S-H-10X-PAK) – for the calibration curve and LCS and obtained from Restek at a concentration of 1000 ug/mL (catalog # 32006) – for ICV.
- 8.2.1 Aroclor 1260 Solution:** Obtained from Accustandard at a concentration of 100ug/mL (catalog # C-260S-H-10X-PAK) – for the calibration curve and LCS and

obtained from Restek at a concentration of 1000ug/mL (catalog # C32012) – for LCS and ICV.

8.2.2 Primary source calibration solutions

<u>Compound</u>	<u>Part Number</u>
Aroclor 1016	C-261S-H-10X-PAK
Aroclor 1221	APP-9-159
Aroclor 1232	APP-9-160
Aroclor 1242	C-242S-H-10X
Aroclor 1248	C-248S-H-10X
Aroclor 1254	C-254S-H-10X
Aroclor 1260	C-260S-H-10X-PAK
Aroclor 1262	APP-9-165
Aroclor 1268	APP-9-166

8.2.3 ICV Aroclor Solutions: Obtained from Ultra at a concentration of 100ug/mL

<u>Compound</u>	<u>Part Number</u>
Aroclor 1016	32006
Aroclor 1221	PP-291
Aroclor 1232	PP-301
Aroclor 1242	PP-311
Aroclor 1248	PP-341
Aroclor 1254	PP-351
Aroclor 1260	C32012
Aroclor 1262	PP-371
Aroclor 1268	PP-381

8.2.4 **Pesticides Surrogate Standard Spiking Solution:** Obtained from Ultra at a concentration of 200ug/mL (catalog # ISM-320) – for PCB Aroclors analysis.

8.2.5 **Internal Standard Solution:** 1-Bromo-2-nitrobenzene (Ultra, Cat. #PPS-351) is used as the internal standard and is added to all single-component calibration standards and sample extracts to achieve a concentration of 0.25µg/mL.

8.3 **Stock Standard Solutions:** All Stock Standard Solutions are prepared volumetrically by diluting and mixing the appropriate primary standard solutions in hexane. Stock standards expire 1 year from the date of preparation or sooner if routine QC tests indicate a problem. All stock solutions are stored in the freezer (-20°C -10C) in 10-40mL vials depending on the amount prepared. If breakdown of a solution is observed, the solution will be discarded.

8.3.1 **Aroclor 1660 Calibration Stock Solution:** Consists of the Aroclor 1016 and 1260 from Accustandard or equivalent, mixed with the extraction surrogates (TMX and DCB), at a stock concentration of 20,000ug/L for AR1660 and 1000ug/L for surrogates, in hexane. To prepare calibration stock solution, add 1mL of *Aroclor 1016/1260 Primary Solution* at 1000ug/mL and 0.5mL of *Pesticides Surrogate Standard Spiking Solution* at 200ug/mL to a 50mL volumetric flask. Dilute to the volume with hexane.

8.3.2 **Aroclor 1660 ICV Stock Solution:** Consists of the Aroclor 1016 and 1260 from Restek or equivalent, at a stock concentration of 20,000ug/L in hexane. To prepare calibration stock solution, add 1mL of an individual *Aroclor Primary Solution* at 1000ug/mL to a 50mL volumetric flask. Dilute to the volume with hexane.

- 8.3.3 **Other Aroclors Calibration Stock Solution:** Consists of the individual Aroclor from Accustandard or equivalent at a stock concentration of 20,000ug/L, in hexane. To prepare calibration stock solution, add 1mL of an *Aroclor Primary Solution* at 1000ug/mL to a 50mL volumetric flask. Dilute to the volume with hexane.
- 8.3.4 **Other Aroclors ICV Stock Solution:** Consists of the individual Aroclor from Ultra or equivalent at a stock concentration of 10,000ug/L, in hexane. To prepare calibration stock solution, add 1mL of an *Aroclor Primary Solution* at 100ug/mL to a 10mL volumetric flask. Dilute to the volume with hexane.
- 8.3.5 **Pesticides Surrogate Stock Solution:** Consists of Pesticides Surrogates (TMX and DCB) from Ultra or equivalent, at a stock concentration of 5000ug/L. To prepare pest surrogate stock solution add 0.625 mL of *Pesticides Surrogate Standard Spiking Solution* at 200ug/L to a 25mL volumetric flask. Dilute to the volume with hexane.

8.4 Working/Spiking Standard Solutions: All working/spiking standard solutions are prepared volumetrically by diluting and mixing appropriate primary or stock standard solutions in acetone, hexane or methylene chloride. Working/Spiking standards expire 6 months from the date of preparation or sooner if routine QC tests indicate the problem. All working/spiking solutions are stored in the freezer (-20°C -10 °C) in 10-40mL vials depending on the amount prepared. All spiking solutions must be assayed for use by analysis before release to the preparation lab. **All compounds must be within 20% of their true value.** If breakdown of a solution is observed, the solution will be discarded.

8.4.1 Aroclor 1660 calibration standard solution: Consists of Aroclor 1016 and 1260 from our "Aroclor 1660 calibration stock solution" combined into one standard called Aroclor 1660 and the extraction surrogates (TMX and DCB) through dilution of Aroclor 1660 Calibration Stock solution. The extraction surrogates will only be combined with the 1660 calibration. An ICAL is run for each of the nine Aroclors before analysis. A 7 pt calibration is analyzed for the 1660 while 1pt calibration is allowed per method for the other 7 aroclors.

7-Level Curve Preparation for Aroclors

<u>Calibration Level</u>	<u>Aroclor Conc.</u>	<u>Surrogate Conc.</u>	<u>Volume of Std Added</u>	<u>Final Volume in Hexane</u>
Stock	20 00µg/L	2000µg/L		
Level1	20µg/L	2.0µg/mL	0.1mL of Level7.	10mL
Level 2	50µg/L	5.0µg/L	0.25mL of Level7	10mL
Level 3	100µg/L	10µg/mL	0.5mL of Level7	10mL
Level 4	250µg/L	25µg/mL	1.25mL of Level7	10mL
Level 5**	500µg/L	50µg/mL	1.25mL of Stock	50mL
Level 6	1000µg/L	100µg/mL	0.5mL of Stock	10mL
Level 7	2000µg/L	200µg/mL	1mL of stock	10mL

** CCV Level

8.4.2 PEST/PCB Surrogate Spike Solution: TMX and DCB obtained from All samples, blank and matrix spike are spiked with 1mL of the surrogate solution prior to extraction to monitor efficiency of sample extraction, chromatographic and calibration system. This amount may be adjusted to meet project specific concentrations, as needed.

- 8.4.3 **PCB Aroclors LCS/LCSD/MS/MSD:** Aroclor 1660 commercially obtained from Accustandard at the concentration of 10,000ug/L in Acetone. To prepare:
- Spiking solution add 1mL of each primary solution at 1000µg/mL to a 100mL volumetric flask and bring it to volume with Acetone.
- 1mL is spiked into each QC and field QC sample. This amount may be adjusted to meet project specific concentrations, as needed.
- 8.4.4 **Independent Verification Standard (ICV) for Aroclors:** This is a source separate from the calibration curve containing one of the nine Aroclors, obtained from Ultra or Restek. Prepare from Stock Solution by diluting in hexane to the concentration of 500ug/L

9. Quality Control

The laboratory must maintain records to document the quality of data that is generated. Ongoing data quality checks are compared with established performance criteria to determine if the results of analyses meet the performance characteristics of the method.

Quality Control (QC) samples are necessary to monitor both the sample extraction and instrument analysis procedures. The Quality Control samples described below are considered the method defaults, and are the minimum requirements, except where noted. Client and Project specific Data Quality Objectives (DQOs) supersede the requirements in this section where applicable. Client or Project specified DQOs shall be included, or referenced, in the final report to the client.

9.1 Blank(s)

- 9.1.1 A method blank must be extracted (spiked with surrogates and/or internal standards) and analyzed once per every 20 samples or per extraction batch, whichever is more frequent. The analysis of the method blank extract will demonstrate the background contamination.
- 9.1.2 An *acceptable* method blank should not contain any individual compound at the concentration of reporting limit, or above. All efforts must be made to identify and eliminate the source of contamination. The presence of analytes at concentrations at or above the reporting limit will warrant application of a "B" qualifier to that target compound(s) on all associated report forms, and perhaps re-extraction of all associated samples. The results are qualified with a "B" for any associated sample concentrations that are less than 10x the blank concentration for the analyte. Surrogate and internal standard recoveries must meet the QC limits for the method blank, see Section 12. Re-extraction must be initiated immediately so that the minimum of time is wasted before re-extraction can occur - if at all possible, this re-extraction should take place within holding time. Re-extraction *corrective action* that would exceed the sample holding time criteria should be discussed with the client, Laboratory Director, QA Manager, and/or Department Manager prior to implementation. Exceptions may be made with approval of the Department Manager if the samples associated with an out of control method blank are non-detect for the affected compound(s) or if the concentrations of the affected compound(s) are greater than 5x the blank level in the samples. In such cases, the sample results are accepted without corrective action for the high method blank result. The client must be notified, via the project narrative, of any method blank non-compliance associated with the sample results. Since air PUF samples cannot be re-extracted, re-analysis for confirmation of any issues must be performed. If similar results are observed, the data is reported with a narrative note discussing the non-compliance.

9.2 Laboratory Control Sample / Laboratory Control Sample (LCS / LCSD)

- 9.2.1 The LCS/ LCSD are extracted along with the samples as a measure of precision and accuracy. At a minimum, one LCS/LCSD sample set must be analyzed at a frequency of once per 20 samples, or per analytical batch, whichever is more frequent. The LCS contains Aroclor 1660.
- 9.2.2 The acceptable recovery QC limits are found in Section 12 for an aqueous, solid, and tissue LCS.
- 9.2.3 Acceptable relative percent difference (RPD) for LCS/LCSD analysis is $\pm 50\%$ for both aqueous and solid matrices. See section 12 for QA acceptance criteria. Calculate RPD as follows:

$$RPD = \frac{R1 - R2}{\frac{R1 + R2}{2}} \times 100$$

- 9.2.4 Corrective Action: Repeat analysis or check to see if an analytical error has occurred. If the LCS recovery is still out of control, re-extract and re-analyze the LCS and all samples associated with that LCS/LCSD. If the LCS/LCSD do not meet quality control criteria for recovery of some of the spike and surrogate compounds, the results for the other samples and quality control samples within the batch must be evaluated to determine if this is an isolated problem for the LCS/LCSD and whether the data should be reported with the affected LCS/LCSD. If the recoveries for all components in the LCS/LCSD are outside of criteria, the entire analytical batch should be re-extracted and re-analyzed. Exceptions may be made with approval of the Department Manager if the samples associated with the out of control LCS/LCSD are also associated with a matrix spike and matrix spike duplicate that is in control which demonstrates an isolated problem pertaining to the LCS/LCSD only. An explanation of this out of control LCS/LCSD recovery must be included in the project narrative to the client and the sample data reported with the acceptable MS/MSD results as batch QC. Since air PUF samples cannot be re-extracted, re-analysis for confirmation of any issues must be performed. If similar results are observed, the data is reported with a narrative note discussing the non-compliance.

9.3 Initial Calibration Verification (ICV)

Refer to section 10.2

9.4 Continuing Calibration Verification (CCV)

Refer to section 10.4

9.5 Matrix Spike / Matrix Spike Duplicate (MS / MSD)

- 9.5.1 MS/MSD analyses are performed once per 20 samples (5% frequency) only per client request. It is preferable to extract samples that have been selected specifically by the client. If none have been assigned then the laboratory analyst must choose a representative sample for each type of matrix prepared. The MS/MSD must be matrix specific. Aqueous and air PUF MS/MSD cannot be done unless client supplies sufficient sample. These samples are also spiked with extraction surrogate. MS/MSD are spiked with the LCS spiking solution at the same level as LCS/LCSD.

9.5.2 The acceptable recovery and RPD QC limits are found in Section 12 for an aqueous, solid, tissue and product MS/MSDs.

9.5.3 Acceptable relative percent difference (RPD) for matrix spike analysis is $\pm 50\%$ for both aqueous and solid matrices. Calculate RPD as follows:

$$\text{RPD} = \frac{R1 - R2}{\frac{R1 + R2}{2}} \times 100$$

9.5.4 Corrective Action: The recovery of the matrix spikes are evaluated relative to the what was in the unspiked sample to indicate how well the methods worked on extraction of the analytes of interest from the sample matrix. The results for the unspiked and MS/MSD samples need to be compared carefully to determine how well the spiking study worked and if there was any indication of matrix-related problems that might affect the analytical batch. Re-extraction of the sample based on the MS results is rare. Repeat analysis or check to see if an analytical error has occurred. If the % recovery or %RPD still exceeds the control limits and the associated LCS is within control, include a project narrative with the results to client noting that there may be potential matrix effects on the accuracy or precision of the affected results as evidenced by the matrix spike and matrix spike duplicate exceedance. Since air PUF samples cannot be re-extracted, re-analysis for confirmation of any issues must be performed. If similar results are observed, the data is reported with a narrative note discussing the non-compliance.

9.6 Laboratory Duplicate

9.6.1 Laboratory matrix or sample duplicates are analyzed if requested by the client. The client must supply sufficient additional sample volume for this duplicate. Duplicates are used to evaluate the precision of the method. The QC limit is 50% RPD for target compounds found above 5 times the reporting limit.

9.6.2 Corrective Action: If the %RPD exceeds the 50% control limit and the associated MS/MSD %RPD is within 50%, include a project narrative with the results to client noting that there may be potential matrix effects on the precision of the results isolated to this sample, as evidenced by the matrix duplicate exceedance and the MS/MSD acceptance. If both the sample/duplicate and the MS/MSD exceed the control limits, include a project narrative with the results to client noting that there may be potential matrix effects on the precision of the results as evidenced by the sample/duplicate and the MS/MSD exceedances. Since air PUF samples cannot be re-extracted, re-analysis for confirmation of any issues must be performed. If similar results are observed, the data is reported with a narrative note discussing the non-compliance.

9.7 Method-specific Quality Control Samples

9.7.1 Surrogates

9.7.1.1 Surrogates are monitored for recovery for all matrices. Two surrogates are used, one that elutes at the beginning and one at the end of GC run: TMX/DCB. Every sample, blank, and quality control sample (LCS, MS, MSD, Dup) must be spiked with the surrogates prior to extraction. The recovery limits are found in Section 12.

9.7.1.2 Corrective Action: Check to see if an analytical, spiking, or dilution error occurred and re-calculate. If only one surrogate falls below the recovery limit and all QC samples have acceptable recovery indicating a matrix effect isolated to the sample, the exceedance is noted, with approval of the Section Supervisor, and the results are reported to the client with a notation in the case narrative. If all surrogates are recovered below the limit or there are outliers in any QC, re-extract the sample. If re-extraction occurred beyond the holding time and the re-extract surrogates are within the QC limits, report the re-extract results along with the original results. If the surrogates are recovered below the limit in the re-extract, this confirms suspected matrix interference on the surrogates, and only the original analysis needs to be reported unless a specific QAPP requires otherwise. If the chromatogram shows obvious matrix interference, no re-analysis or re-extraction is necessary. *This decision must be made with approval of the Section Supervisor and/or Project Manager.* Surrogate outliers and sample re-extracts must be noted in the case narrative to the client.

9.7.2 Internal Standards

9.7.2.1 Internal Standards will be evaluated for relative retention time drift and relative area counts compared to the associated opening CCV. Internal standards are added to every field sample, QC sample, standard, and method blank. The internal standard retention times for associated samples should be ± 0.05 minutes relative to the retention times from the associated opening CCV. The area counts for the internal standards in the associated samples should be $\pm 50\%$ of the area of the internal standard calculated during initial calibration. The daily opening CCV IS areas are also compared to the ICAL.

9.7.2.2 Corrective Action: Check to see if an analytical, dilution or spiking error occurred. If the chromatogram shows obvious matrix interference, no re-analysis is necessary. *This decision must be made with approval of the Department Manager.* Note the exceedance in the case narrative to the client. If no obvious interference is present, re-analyze the extract. If internal standards are now within the acceptance limits, report only the re-analysis, as long as the re-analysis occurred within the 40-day analytical hold time. If the re-analysis occurred outside of the 40-day analytical hold time, both the original and re-analysis must be reported. If the internal standards again are outside the acceptance limits, after re-analysis, either within or outside of the 40-day hold time, report only the original analysis, and include a narrative to the client that the suspected matrix interference on the internal standards was confirmed by sample re-analysis. If specified by the client or project data quality objectives (DQOs) or other specifications, both results of both analysis might have to be reported.

9.7.3 Standard Reference Materials (SRMs)

9.7.3.1 Standard reference materials (SRMs) are available from the National Institute of Standards and Technology (NIST) and are extracted and analyzed with samples only on a project specific basis. For sediment and tissue sample batches, a certified SRM will be analyzed at the rate of one per batch of up to 20 samples per matrix. These are not used as controls, but to evaluate potential matrix effects in associated samples for the target compounds being evaluated.

- 9.7.3.2 Measured results will be compared against certified values for those target analytes that are certified in these SRMs as follows. Acceptance criteria for SRM analysis will vary from project to project depending upon client data quality objectives (DQOs). Generally, $\pm 50\%$ difference (%D) based on the true certified values of the target compounds of interest, or 40% - 140% recovery, serve as advisory acceptance criteria.
- 9.7.3.3 Corrective Action: Repeat analysis and/or check to see if an analytical error has occurred. If the % recovery or %D still exceeds the control limits and the associated LCS/LCSD and/or MS/MSD are within control, include a project narrative with the results to client noting that the observed recovered of the SRM are isolated to this sample as evidenced by the LCS/LCSD and/or MS/MSD acceptance. Individual analyte exceedances will be narrated and may be used to assess potential interferences or system bias for individual analytes.

9.8 Method Sequence

- 9.8.1 An example calibration and sample sequence for 8082 Aroclor analysis listed below. Calibration points, ICV, CCV identifiers and/or nomenclature can be associated according to date/instrument or a specifically generated WG (workgroup) reference number assigned by the company LIMS system. Laboratory standard identification should be entered under the misc information section of each datafile for traceability of all standards utilized.
- 9.8.2 Listed below is an example of a calibration whereas seven calibration points were analyzed on 3/6/18. "I6" = Instrument ECD6. "CQ6" = ICV ECD6
- 9.8.3 **Example Calibration Sequence**
1. Prime and/or Hexane
 2. I603161801 (calibration standard level 1 1660 + surrogates)
 3. I603161802 (calibration standard level 2 1660 + surrogates)
 4. I603161803 (calibration standard level 3 1660 + surrogates)
 5. I603161804 (calibration standard level 4 1660 + surrogates)
 6. I603161805 (calibration standard level 5 1660 + surrogates)
 7. I603161806 (calibration standard level 6 1660 + surrogates)
 8. I603161807 (calibration standard level 7 1660 + surrogates)
 9. Hexane
 10. CQ603161801 (Initial Calibration Verification Standard 1660)
 11. Hexane
 12. I603161808 – 2162
 13. CQ603161802 – 2162
 14. I603161809 – 3268
 15. CQ603161803 – 3268
 16. I6031618010 – 1242
 17. CQ603161804 – 1242
 18. I603161811 – 1248
 19. CQ603161805 – 1248
 20. I603161812 – 1254
 21. CQ603161806 – 1254

NOTE: If multiple calibration mixtures are analyzed, it is acceptable to analyze appropriate ICVs after all calibration standards have been injected.

9.8.4 Example environmental sample sequence

An example sequence for 8082 Aroclor analysis listed below. CCV identifiers and/or nomenclature can be associated according to date/instrument or a specifically generated WG (workgroup) reference number assigned by the company LIMS system.

1. Prime and/or Hexane
2. C4120401STD2162 AR1221/1262 Level 5 @ 500ug/L *
3. C4120401STD3268 AR12321268 Level 5 @ 500ug/L *
4. C4120401STD1242 AR1242 Level 5 @ 500ug/L *
5. C4120401STD1248 AR1248 Level 5 @ 500ug/L *
6. C4120401STD1254 AR1254 Level 5 @ 500ug/L *
7. C4120401STD1660 AR1660 Level 5 @ 500ug/L
8. Method Blank
9. Method LCS
10. Method LCSD
11. Up to 7 client sample injections
12. Repeat injections 1-11 as needed

10. Procedure

10.1 Equipment Set-up

10.1.1 Prior to performing GC/ECD analysis, the operator must read and become familiar with the operating procedure guidelines specified in the instrument operating manuals. The analyst must be trained and familiarized with the instrument software provided by the manufacturer. The instrument must be set up with the proper operating parameters (data acquisition and processing) and conditions described in the operating manual. The criteria for the analytical calibration ranges and method and instrument detection limits must be established and documented prior to initial calibration. All analytical equipment is traceable to NIST via internal and external calibration checks and *Certificates of Analysis* that are received with the calibration standards.

10.1.2 Establish daily retention time windows as the retention time of the component in the opening verification standard ± 0.05 . Retention time windows are calculated each time a new GC column is installed. It has been found that this window works well, being wide enough to eliminate false-negatives while being tight enough to eliminate false-positives. Windows that are calculated using the procedure recommended in Method 8000 tend to be very narrow, creating the risk of false negative results. The window listed above is used as guidance; however the experience of the analyst weighs heavily in the interpretation of the chromatograms.

10.1.3 GC Instrument Conditions:

The dual-column / dual-detector approach involves the use of the columns listed in section 7.2.1 the columns are connected to an injection tee or dual injection GC, and separate electron capture detectors. Alpha typical GC conditions are listed below, but may be altered as long as method performance criteria are met. Inject an aliquot of 1ul into the capillary column of the gas chromatograph at the following conditions.

Temperature1: 120 °C

Injector temperature: 250°C

Time1: 0 minutes

Injector mode: Pulsed Split

Ramp1: 45 ^o C/minute	1.4:1 split, 0.20 min pulse
Temperature2: 200 ^o C	Injector Flow: 5.7 ml/min split flow
Time2: 0 minutes	Detector temperature: 350 ^o C
Ramp2: 15 ^o C/minute	Carrier gas: Helium
Temperature3: 230 ^o C	Carrier flow: 20ml/min
Time3: 0 minutes	Carrier mode: Constant flow
Ramp3: 30 ^o C/minute	Makeup gas: Nitrogen
Final temperature 330 ^o C	Total detector flow: 55ml/min
Final time: 2 minutes	Injection Volume: 1 µL

10.2 Initial Calibration

- 10.2.1 Prepare calibration standards using the standards listed in Section 8.
- 10.2.2 Establish the GC operating conditions by loading the appropriate GC method. Typical instrument conditions are listed in section 10.1.3.
- 10.2.3 A 1µL injection volume of each calibration standard is typically used. Other injection volumes may be employed, provided that the analyst can demonstrate adequate sensitivity for the compounds of interest. The same injection volume must be used for all standards and samples.
- 10.2.4 Column adsorption may be a problem when the GC has not been used for a day or more or after system maintenance. The GC column may be primed (or deactivated) by injecting a PCB standard mixture approximately 20 times more concentrated than the mid-concentration standard. Inject this standard mixture prior to beginning the initial calibration or calibration verification. Alternately, the system may be primed by baking at the final analytical temperature for approximately 30 minutes. Several analytes may be observed in the injection just following system priming. Always run an instrument blank after system priming.
- 10.2.5 Calibration Factor: Internal standard calibration techniques are employed in this method. In each standard, calculate the response factor (RF) for each analyte, the average RF, and the relative standard deviation (RSD) of the RFs, using the Enviroquant data processing software. The calculations are performed automatically, using the formula listed in Alpha's Quality Manual.
- 10.2.6 Initial Calibration Criteria If the RSD for an analyte is < 20%, then the response of the instrument for this compound is considered linear over the range and the mean calibration factor can be used to quantitate sample results. If the RSD for any analyte is > 20%, then linearity through the origin cannot be assumed. The mean response factor cannot be used for quantitation. An alternative calculation may be done by the use of linearity as long as the correlation coefficient is >0.995. If both of these quantitation methods fail criteria for any compound in the initial calibration, then the system must be reevaluated and a new calibration curve must be analyzed.
- 10.2.7 Initial Calibration Verification An initial calibration verification standard must be run immediately after each initial calibration, near the midpoint of the curve. The standard must be prepared using a second source that is different than the source used for the initial calibration. (Standards listed in Section 8). The %D has to be within 20%. The retention time window used for the identification of target analytes is ± 0.07 minutes.

These criteria have been adopted from the EPA CLP Statement of Work (OLM04.2). It has been found that these limits work well, being wide enough to eliminate false-negatives while being tight enough to eliminate false-positives. Windows that are calculated using the procedure recommended in Method 8000 tend to be very narrow, creating the risk of false negative results.

- 10.2.8 The windows listed above are used as guidance; however the experience of the analyst weighs heavily in the interpretation of the chromatograms. For example, it has been observed that certain oil matrices can cause the retention times to shift more dramatically.

10.3 Equipment Operation and Sample Processing

- 10.3.1 The determination of PCB Aroclors is accomplished by comparing the sample chromatogram to that of the most similar Aroclor standard. The aroclor pattern must be present on both columns to confirm the Aroclor identification. The use of PCB overlays is extremely helpful, either by using hardcopies of chromatograms or by utilizing the Enviroquant software. A choice must be made as to which Aroclor is most similar and whether that standard is truly representative of the PCB in the sample. Both retention time and pattern are important when determining PCBs in a sample. Samples that contained weathered PCB present special analytical challenges. Weathering could alter the Aroclor pattern to the extent that different peaks have to be selected for quantitation. Samples that contained more than one Aroclor present similar problems. For these samples, the Analyst may have to consider selecting the earlier eluting peaks for the lower boiling Aroclor and selecting the later eluting peaks for the higher boiling Aroclors to minimize overlapping peaks. Minimum of 3 peaks must be chosen for each Aroclor. If compound identification or quantitation is precluded due to interference (e.g., broad, rounded peaks or ill-defined baselines are present) cleanup of the extract may be needed. If instrument problems are suspected, rerun the extract on another instrument to determine if the problem results from analytical hardware or the sample matrix. The laboratory must report the higher of the two columns' results unless obvious interference is present on one of the columns.
- 10.3.2 Verify calibration each 12-hours shift by injecting calibration verification standards prior to conducting any sample analyses. A calibration standard must also be injected at intervals of not less than once every twenty injections. A bracketing CCV is not required with the use of internal standard calibration (Method 8082A 11.6.8) with the exception of samples ran under CT RCP method. For Aroclor analysis, the calibration verification standard should be a mixture of Aroclor 1016 and 1260.
- 10.3.3 The response factor (for internal standard compounds) for each analyte to be quantitated must not exceed a $\pm 20\%$ difference when compared to the initial calibration curve (+ 15% for CT RCP). The Target data processing software automatically calculates the %D for all analytes according to the formulae in Alpha's Quality Manual. A retention time shift >30 seconds for the internal standard necessitates reanalysis of all affected samples.
- 10.3.4 Routine preventive maintenance is performed to maintain GC system performance. This includes periodic replacement of injector septa, replacement of injector liner(s), and replacement of injector seals. Other Maintenance: ECD detectors may become contaminated, requiring bake out at elevated temperatures, (no greater than 375°C) or repair by the manufacturer.
- 10.3.5 If the on-column concentration of any compound exceeds the calibration range of 2000ug/L, the sample must be diluted, re-spiked with the appropriate amount of internal standard and re-analyzed.

10.4 Continuing Calibration

10.4.1 Verify calibration each 12-hours shift by injecting calibration verification standards prior to conducting any sample analyses. A calibration standard must also be injected at intervals of not less than once every twenty injections. A bracketing CCV is not required with the use of internal standard calibration (Method 8082A 11.6.8) with the exception of samples ran under CT RCP method. For Aroclor analysis, the calibration verification standard should be a mixture of Aroclor 1016 and 1260. The calibration verification process does not require analysis of the other Aroclor standards used for pattern recognition (Method 8082A 11.6.2)

10.4.2 The response factor (for internal standard compounds) for each analyte to be quantitated must not exceed a $\pm 20\%$ difference when compared to the initial calibration curve (+ 15% for CT RCP). A retention time shift >30 seconds for the internal standard necessitates reanalysis of all affected samples.

10.5 Preventive Maintenance

10.5.1 Preventive maintenance may or may not include the following; replacing system uniliner, o-ring, merlin septum, MXTY connector or clipping a length of guard column.

10.5.2 Additionally, preventive or routine maintenance for GC/ECD systems may involve baking out the ECD detectors, replacing guard, RTX-5 or CLPII columns.

11. Data Evaluation, Calculations and Reporting

11.1 Quantitation of Aroclors

Quantitation is based on the use of a minimum of 3 of the major peaks present in the analyte, although the use of 5 of the major peaks is recommended. Each of these peaks is individually calibrated with a minimum of five calibration points based on average response factors. The %RSD must meet the criteria of <20% for the ICAL. The five major peaks are calculated as described below. After individual calculation meets criteria, the average of the peaks selected for quantitation is used to determine the final concentration.

11.2 Aqueous samples

$$\text{Concentration } (\mu\text{g/L}) = \frac{C \times DF \times V_f \times 1000}{V_o}$$

C = Extract concentration ($\mu\text{g/mL}$), NOTE: ng on column = ng/injection volume = ng/ μL = $\mu\text{g/mL}$

DF = Dilution factor

V_f = Final extract volume (mL)

V_o = Sample volume (mL)

11.3 Soil/sediment samples

$$\text{Concentration } (\mu\text{g/Kg, dry weight}) = \frac{C \times DF \times V_f \times 1000 \div \%S}{W \text{ (g)}}$$

C = Extract concentration ($\mu\text{g/mL}$), NOTE: ng on column = ng/injection volume = ng/ μL = $\mu\text{g/mL}$

DF = Dilution factor

V_f = Final extract volume (mL)

W = Weight of the sample extracted (10g for high, 30g for low)

%S = Percent solids, as a decimal value

11.4 PUF samples

$$\text{Concentration (ng/cart)} = \frac{C \times DF \times Vf}{W}$$

C = Extract concentration (µg/L)
 DF = Dilution factor
 Vf = Final extract volume (mL)
 W = Weight of the sample. for Air PUF, sample amount is 1

11.5 Reporting Results

After performing technical data review, validating that all QC criteria have been met and confirming all positive hits, the data report is sent electronically to the LIMS computer for generation of the client report. There are two levels of review of the data in the LIMS system prior to release of data. These reviews must be done by two separate individuals.

12. Contingencies for Handling Out-of-Control Data or Unacceptable Data

Holding time exceedance and/or improper preservation are noted on the nonconformance report form.

Perform instrument maintenance as described throughout this SOP as needed when instrument calibration criteria are not met. Record all maintenance in the instrument logbook.

All batch and sample specific QC criteria outlined in Section 10 are evaluated by the analyst prior to approval of the data. When any QC criteria fail, the cause for the failure must be identified and corrected. This may include instrument recalibration followed by sample reanalysis, sample cleanup, or sample re-extraction. If it is determined that the failure is due to sample matrix effects, a project narrative report is written into the LIMS by the analyst for inclusion in the data report. If there is insufficient sample volume to perform the re-analysis for confirmation, this is also noted in the narrative and included in the client report.

All PCB Aroclor results are reportable without qualification if analytical holding times are met, preservation requirements (including cooler temperatures) are met, and all QC criteria defined in the table below are met. If any of the below QC parameters are not met, all associated samples must be evaluated for re-analysis.

QC Parameter	Acceptance Criteria
Initial Calibration Curve	20% RSD for all target analytes Correlation coefficient must be ≥ 0.99 – for linear model The COD or r^2 must be ≥ 0.99 – for non-linear model
Independent Check Verification	+/- 20% recovery of the true values, For Aroclors the Average of the 5 representative peaks are calculated to get the %D.
Continuing Calibration Verification	Analyzed every 12hr or at the minimum of every 20 samples, 20% D for all target analytes. For Aroclors the Average of the 5 representative peaks are calculated to get the %D.
Method Blank	No analyte at or above the reporting limit, “B” qualify analyte if detected < 10x the blank contamination

Printouts of this document may be out of date and should be considered uncontrolled. To accomplish work, the published version of the document should be viewed online.

Laboratory Control Sample	Soil/Tissue/Aqueous/PUF: 40-140%; 50% RPD
Matrix Spike / Matrix Spike Duplicate	Same as for LCS; 50% RPD between the duplicates.
Sample / Sample Duplicate	50% RPD between the duplicates.
Surrogates	Soil: 30-150%; Aqueous: 30-150%; PUF: 60-120%
Internal Standards	50% - 200% of the daily CCV area for the Internal Standards
SRM	Same as for LCS, 40% - 140% recovery

Any deviations and observations made about the analyses must be documented in the instrument logbook and or project narrative. If a problem arises during analysis, document the problem and initiate corrective action. If there is a problem with a sample analysis which indicates that re-extraction should be performed, and if there is no additional sample available for re-extraction, the Project Manager needs to be informed immediately so that the client can be involved in the corrective action process. Re-extraction of a sample should be done within holding time if at all possible.

Evaluation of a sample result often requires knowledge about the results of all samples within a job. Therefore, use all of the data, if possible, from a job to judge whether or not corrective actions are needed. For example, if a sample is run and the surrogates are low, one might request a re-extraction immediately only to find that a MS/MSD were also done on this sample, with low surrogate and MS recoveries, confirming a matrix effect. In this case, a re-extraction is not required and the results would be reported with a narration explaining the evidence of a matrix effect on the low surrogate recoveries. The characteristics of the overall job may be invaluable in deciding how to report the data to the client.

If non-compliant PCB Aroclor results are to be reported, the Department Manager and/or the Laboratory Director, and the QA Manager must approve the reporting of these results. The laboratory Project Manager shall be notified, and may choose to relay the non-compliance to the client, for approval, or other corrective action, such as re-sampling and re-analysis. The analyst or Department Manager performing the secondary review initiates the project narrative, and the narrative must clearly document the non-compliance and provide a reason for acceptance of these results.

13. Method Performance

13.1 Detection Limit Study (DL) / Limit of Detection Study (LOD) / Limit of Quantitation (LOQ)

The laboratory follows the procedure to determine the DL, LOD, and/or LOQ as outlined in Alpha SOP/1732. These studies performed by the laboratory are maintained on file for review.

13.2 Demonstration of Capability Studies

Refer to Alpha SOP/1739 for further information regarding IDC/DOC Generation.

13.2.1 Initial (IDC)

The analyst must make an initial, one-time, demonstration of the ability to generate acceptable accuracy and precision with this method, prior to the processing of any samples.

13.2.2 Continuing (DOC)

The analyst must make a continuing, annual, demonstration of the ability to generate acceptable accuracy and precision with this method

14. Pollution Prevention and Waste Management

Refer to Alpha's Chemical Hygiene Plan and Waste Management and Disposal SOP for further pollution prevention and waste management information.

Blue Bell, Pennsylvania

Subject: Geophysical Investigation Results
Amtrak East Barracks Site
Cook Avenue
Trenton, New Jersey

Dear Ms. Lindhardt,

Subsurface Environmental Technologies (SET) presents this report to Wood of Blue Bell, Pennsylvania describing the objectives, methods and results of a geophysical investigation conducted at the Amtrak East Barracks Site located at the northern end of Cook Avenue, in Trenton, New Jersey. For this project, SET surveyed a roughly-rectangular area (1800 feet by 80 feet) that was defined by Wood in their RFP and in the field. The field activities for this investigation were completed by SET on Tuesday, August 20 (2 crews), Friday August 23, and Monday August 26, 2019.

Objectives

As stated in the Wood Request for Bid, the primary objective of this geophysical survey was to identify buried utilities and subsurface anomalies in the survey area. The results of the survey will help guide future subsurface activities to be conducted by Wood.

At the time of our survey, detailed subsurface information was not available and it was uncertain where buried features may be present. SET did contact the City of Trenton Sewer Department, which provided historic documents pertinent to the survey area. The geophysical data was analyzed closely for the targets described above. To meet the objective of the investigation, SET used the electromagnetic (EM), the ground-penetrating radar (GPR), hand-held electromagnetic (HHEM), and radiofrequency (RF) methods.

Survey Grids

SET collected EM31 data in the scan mode throughout the survey area. During the survey, the traverse paths were continuously monitored so the line separations were approximately 5-10 feet apart, and the lines were parallel to one another. The positions of any buried anomalies that were detected in the field were marked on the ground with spray paint for reference purposes. SET also took numerous photographs to document the locations of these buried features.

In the field, SET revisited each EM anomaly location with our GPR equipment for further characterization. Typically, several GPR profiles were collected in two or more orientations over each anomalous area. This data was critical for target confirmation, and refinement of target dimensions and depth. In addition, GPR HHEM, and RF data was collected in a reconnaissance mode over larger areas. SET also removed manhole

covers at several locations to corroborate pipeline directions and positions. Brush clearing was also required along southern sections of the survey area.

Geophysical Methods

Electromagnetic Method

The electromagnetic (EM) method uses the principle of electromagnetic induction to measure the variability of electrical conductivity of subsurface materials and the presence of buried metal objects. Significant contrasts in the electrical properties between non-indigenous materials and surrounding soil enable accurate delineation of buried waste materials, fill, and air spaces. The large EM response to metal makes this technique particularly well suited to identifying buried metal objects such as metallic wastes, USTs, buried drums, pipelines, reinforced building foundations, or other metal components of buried structures. It is, however, equally sensitive to metal objects on the ground surface, and it is important to take careful field notes that indicate the position of surface metal to avoid mis-interpretation.

The EM-31 ground conductivity meter by Geonics was used to measure the presence of buried metal objects such as USTs, and to determine the electrical conductivity of the underlying soils. The EM-31 is a one-man, portable system that induces a sinusoidal, 9.8 kilohertz (kHz) signal into the ground. The transmitted signal induces eddy currents into the subsurface materials, which, in turn, generate a secondary magnetic field that is measured by the receiver coil. Two measurements are recorded at each station point; the in-phase response, which is measured in parts per thousand (ppt), and the quadrature response, which is measured in milliSeimens per meter (mS/m). For the interpretation of high-conductivity targets such as USTs, the in-phase response is more discriminative. Lower contrast targets such as clay layers, contaminant plumes, and waste disposal areas are better indicated with the quadrature response. The EM data can be viewed in contour or profile format, or the data can be acquired in a scan mode. SET used a Trimble ProXRS Global Positioning System (GPS) concurrently with the EM31 survey.

Ground Penetrating Radar (GPR) Method

The ground-penetrating radar (GPR) method was used to provide subsurface imaging information throughout the areas of investigation. The GPR method is based upon the transmission of repetitive, radio-frequency electromagnetic (EM) pulses into the subsurface. When the transmitted energy of down-going wave contacts an interface of dissimilar electrical character, part of the energy is returned to the surface in the form of a reflected signal. This reflected signal is detected by a receiving transducer and is displayed on the screen of the GPR unit as well as being recorded on the internal hard-drive. The received GPR response remains constant as long as the electrical contrast between media is present and constant. Lateral or vertical changes in the electrical properties of the subsurface result in equivalent changes in the GPR responses. The system records a continuous image of the subsurface by plotting two-way travel time of the reflected EM pulse versus distance traveled along the ground surface. Two-way travel time values are then converted to depth using known soil velocity functions.

The GPR field procedures involved (1) instrument calibration, (2) test run completion, (3) production profile collection and recording, and (4) data storage for subsequent processing and analysis in the office.

Each radar profile was examined for characteristic GPR signatures that may indicate the presence of buried targets. A Geophysical Survey System SIR System 2 and a 400 megahertz (MHz) antenna were used with a recording window of 60 nanoseconds (ns) to provide the required depth penetration and subsurface detail.

Radio-Frequency Method

The RadioDetection RD7000 multi-frequency utility locating system was used for this project. This instrument consists of a receiver/tracer and a remote transmitter, which operates at frequencies between 8 kHz and 200 kHz. The unit provides audio and visual feedback to the operator when a utility that is coupled with the transmitted signal is crossed. The transmitter produces a radio-frequency signal in the utility to be traced by either induction coupling or direct hookup. The receiver output provides measured field strength of the received signal and varies an audible pitch that is dependent upon the distance to the utility. By carefully adjusting the gain of the receiver, it is possible to determine the location of the utility and to separate it from possible adjacent utilities. In addition, the receiver can be used in 60 Hz passive mode to identify active electrical lines or lines that possess an induced current.

Hand-Held Electromagnetic Method

The hand-held electromagnetic method uses the principle of electromagnetic induction to detect shallowly-buried metal objects such as underground storage tanks (USTs), metal utility conduits, reinforced concrete slabs, manhole covers, and miscellaneous metal debris. To complete this task, the operator carries the hand-held radio transmitter-receiver unit above the ground and continually scans the surface. A primary coil broadcasts a radio signal from the transmitter. This primary radio signal induces secondary electrical currents in metal objects. These secondary currents, in turn, produce a magnetic field which is detected by the receiver.

The HHEM instrument we typically use for shallow investigations is a Fisher TW-6 pipe and cable locator by Fischer, Inc. This instrument operates by generating both a unitless meter reading and an audible signal response when near a metal object. The peak instrument response usually occurs when the unit is directly over the object.

Results

SET has enclosed ten (10) figures with this report. Figure 1 is an annotated geo-referenced orthophoto that shows the locations of buried utilities and anomalies over the entire site, Figure 2 is an annotated geo-referenced orthophoto that shows the locations of buried utilities and anomalies over the northern Cook Avenue area, Figure 3 shows an annotated map from The City of Trenton, and Figures 4 through 10 show site photographs. The results of the geophysical survey are summarized below.

Buried Utilities

SET detected several buried pipelines in the survey area. Their map locations are shown on Figures 1 and 2, and site photos of some pipelines are shown in Figures 4-10. SET used the American Public Works

Association (APWA) color guidelines for placing these lines on our figures. Using this system, red lines represent electric, orange lines represent telecommunication, yellow lines represent gas, blue lines represent water, green lines represent storm and sewer, and SET used magenta for unknown lines.

An important storm line was found that ran from a manhole in Cook Avenue to the north, then angled to the east along a gravel access road. This line intersected three manholes. To corroborate the presence and location of this line, SET contacted The City of Trenton Sewer Department, and a map from 1994 showing this line was forwarded to SET. The line was designated as Drain 18 and it ran from Cook Avenue to Olden Road, to the east. It indicated the pipe was 5.5 feet in diameter (also observed by SET when opening the manhole covers), showed a similar position, and confirmed that three manholes were present in the survey area. The manhole designations were, from west-to-east, 18-4, 18-3, and 18-2. The approximate manhole inverts are shown on Figure 3, as well. Flow is from west to east.

SET detected a water line that ran from a manhole in Cook Avenue to the north. This line then angled to the west where it ran below an existing water cap next to the trailer. This line provided water to the trailer. It then continued to the west below the railroad fencing.

SET also detected a sewer line that ran from a manhole on Cook Avenue to the north in roughly the same orientation as the water line described above. This line also angled to the west and terminated at a large manhole cover next to the trailer.

Several electric and unknown lines were also detected and marked on the ground with spray paint. Again, numerous site photographs were taken in the field and included with this report. It is important to note that large soil containers were present in the western side of the survey area during our investigation.

Buried Railroad Tracks

SET detected sections of buried railroad track in the eastern part of the survey area. The track exhibited strongly-negative EM responses in areas directly over and adjacent to the tracks, as shown in Figures 1 and 2. SET noticed that the buried tracks were partly, an extension of existing tracks that were observed at the ground surface to the east.

Data Quality

The data quality for this project was moderate to good. There were some ambiguities regarding potential lines around the perimeter of the building foundation, however the data provided very good subsurface information in the remaining areas. The EM, GPR, and RF responses were consistent and correlated well between profiles. The interpretations presented in this report are based on observed geophysical responses, visual observations, and historical information.

Notes:

- (1) The objective of this geophysical survey was to locate buried utility pipelines and subsurface anomalies in the survey area that may interfere with proposed soil removal activities. To meet the objectives of the investigation, SET used an EM31 electromagnetic conductivity (EM) unit by Geonics, Inc, a SIR System 3000 Ground Penetrating Radar (GPR) unit with a 400 MHz antenna by GSSI, Inc., a Radiofrequency (RF) device by Radiodetection, Inc., and a Fisher TW-6 M-Scope. These instruments provided excellent subsurface information to a depth of approximately 4-15 feet bgs.
- (2) Figure 1 is an annotated geo-referenced orthophoto that shows buried utilities and surface features such as manholes, railroad track, water vault, and others. Figures 2-5 show site photographs of these same features.
- (3) SET detected several buried lines in the survey area. These included storm, electric, water, sewer, and unknown lines. Their approximate positions are shown on the map and site photos. It is important to note that the storm line location detected by SET was confirmed with a map provided by the City of Trenton Sewer Department. The invert data from this map was also included. SET used the American Public Works Association (APWA) color guidelines for placing these lines on our figures. Using this system, red lines represent electric, orange lines represent telecommunication, yellow lines represent gas, blue lines represent water, green lines represent storm and sewer, and SET used magenta for unknown lines.
- (4) The positions on this map should be considered approximate, as should the coordinates presented in the table. They were not measured by a licensed surveyor.
- (5) The items on this figure may not be all inclusive. SET does not warrant the fact that additional buried features may be present at this site.

These instruments provided excellent subsurface information to a depth of approximately 4-15 feet bgs.
 - (2) Figure 3 is an annotated map that was provided by The City of Trenton Sewer Department. It shows a storm line that runs through the survey area. Based on a visual inspection of two of the manholes and the invert data shown on the map, the water flows from west-to-east. The pipe is 5'-6" in diameter and is made of concrete. Three manholes were present along the line that include 18-2, 18-3, and 18-4. Manhole 18-2 and 18-3 were observed at the ground surface and manhole 18-4 was buried beneath the access road. Its location on the map is approximate. Unfortunately, the geophysical equipment was adversely affected by an adjacent electric line.
 - (3) The positions on this map should be considered approximate, as should the coordinates presented in the table. They were not measured by a licenced surveyor.
 - (4) The items on this figure may not be all inclusive. SET does not warrant the fact that additional buried features may be present at this site.

Notes:

- (1) The objective of this geophysical survey was to locate buried utility pipelines and subsurface anomalies in the survey area that may interfere with proposed soil removal activities. To meet the objectives of the investigation, SET used an EM31 electromagnetic conductivity (EM) unit by Geonics, Inc, a SIR System 3000 Ground Penetrating Radar (GPR) unit with a 400 MHz antenna by GSSI, Inc., a Radiofrequency (RF) device by Radiodetection, Inc., and a Fisher TW-6 M-Scope. These instruments provided excellent subsurface information to a depth of approximately 4-15 feet bgs.
- (2) Figure 1 is an annotated geo-referenced orthophoto that shows buried utilities and surface features such as manholes, railroad track, water vault, and others. Figures 2-5 show site photographs of these same features.
- (3) SET detected several buried lines in the survey area. These included storm, electric, water, sewer, and unknown lines. Their approximate positions are shown on the map and site photos. It is important to note that the storm line location detected by SET was confirmed with a map provided by the City of Trenton Sewer Department. The invert data from this map was also included. SET used the American Public Works Association (APWA) color guidelines for placing these lines on our figures. Using this system, red lines represent electric, orange lines represent telecommunication, yellow lines represent gas, blue lines represent water, green lines represent storm and sewer, and SET used magenta for unknown lines.
- (4) The positions on this map should be considered approximate, as should the coordinates presented in the table. They were not measured by a licensed surveyor.
- (5) The items on this figure may not be all inclusive. SET does not warrant the fact that additional buried features may be present at this site.

Methodology Review

Project Name: AMTRAK EAST BARRACKS
Project Number: 277710568.0008.06

Lab Number: L2005778
Report Date: 02/21/20

REFERENCES

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Laboratory Chronicle

Sample Receipt and Container Information

Were project specific reporting limits specified?

YES

Cooler Information

Cooler **Custody Seal**
 A Absent

NJ DEP
Data of Known Quality Protocols
Conformance/Non-Conformance
Summary Questionnaire

**NJ DEP Data of Known Quality Protocols
 Conformance/Non-Conformance
 Summary Questionnaire**

1	For each analytical method referenced in this laboratory report package, were all specified QA/QC performance criteria followed, including the requirement to explain any criteria falling outside of acceptable guidelines, as specified in the NJDEP Data of Known Quality performance standards?	YES
1a	Were the method specified handling, preservation, and holding time requirements met?	YES
1b	EPH Method: Was the EPH Method conducted without significant modifications (see Section 11.3 of respective DKQ methods)?	N/A
2	Were all samples received by the laboratory in a condition consistent with that described on the associated chain-of-custody document(s)?	YES
3	Were all samples received at an appropriate temperature ($4 \pm 2^\circ \text{C}$)?	YES
4	Were all QA/QC performance criteria specified in the NJDEP DKQP standards achieved?	NO
5a	Were reporting limits specified or referenced on the chain-of-custody or communicated to the laboratory prior to sample receipt?	YES
5b	Were these reporting limits met?	NO
6	For each analytical method referenced in this laboratory report package, were results reported for all constituents identified in the method-specific analyte lists presented in the DKQP documents and/or site-specific QAPP?	YES
7	Are project-specific matrix spikes and/or laboratory duplicates included in this data set?	YES

Note: For all questions to which the response was "No" (with the exception of question #7), additional information must be provided in an attached narrative. If the answer to question #1, #1a or #1b is "No", the data package does not meet the requirements for "Data of Known Quality".

Conformance/Non-Conformance Summary

Project Name: AMTRAK EAST BARRACKS
Project Number: 277710568.0008.06

Lab Number: L2005778
Report Date: 02/21/20

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Project Name: AMTRAK EAST BARRACKS
Project Number: 277710568.0008.06

Lab Number: L2005778
Report Date: 02/21/20

Case Narrative (continued)

Report Submission

February 21, 2020: This final report includes the results of the PCBs analysis performed on L2005778-18.

February 14, 2020: This is a preliminary report.

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

DKQP Related Narratives

PCBs

In reference to question 5b:

L2005778-16, -17, -21, and -26: One or more of the target analytes did not achieve the requested regulatory limits.

In reference to question 4:

L2005778-16, -17, and -21: The surrogate recoveries are below the acceptance criteria for 2,4,5,6-tetrachloro-m-xylene (0%) and decachlorobiphenyl (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis are reported.

L2005778-19: One or more surrogates failed to meet the DKQP recovery limits. Please refer to the sample results and/or QC section of the report for specific details.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Authorized Signature:  Report Date: 02/21/20

Title: Technical Director/Representative

Glossary

GLOSSARY

Acronyms

DL	- Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EMPC	- Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LOD	- Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
LOQ	- Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.) Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TEF	- Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.
TEQ	- Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

Report Format: DU Report with 'J' Qualifiers

Project Name: AMTRAK EAST BARRACKS
Project Number: 277710568.0008.06

Lab Number: L2005778
Report Date: 02/21/20

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PAH Total: With respect to Alkylated PAH analyses, the 'PAHs, Total' result is defined as the summation of results for all or a subset of the following compounds: Naphthalene, C1-C4 Naphthalenes, 2-Methylnaphthalene, 1-Methylnaphthalene, Biphenyl, Acenaphthylene, Acenaphthene, Fluorene, C1-C3 Fluorenes, Phenanthrene, C1-C4 Phenanthrenes/Anthracenes, Anthracene, Fluoranthene, Pyrene, C1-C4 Fluoranthenes/Pyrenes, Benz(a)anthracene, Chrysene, C1-C4 Chrysenes, Benzo(b)fluoranthene, Benzo(j)+(k)fluoranthene, Benzo(e)pyrene, Benzo(a)pyrene, Perylene, Indeno(1,2,3-cd)pyrene, Dibenz(ah)+(ac)anthracene, Benzo(g,h,i)perylene. If a 'Total' result is requested, the results of its individual components will also be reported.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. If a 'Total' result is requested, the results of its individual components will also be reported.

The target compound Chlordane (CAS No. 57-74-9) is reported for GC ECD analyses. Per EPA, this compound "refers to a mixture of chlordane isomers, other chlorinated hydrocarbons and numerous other components." (Reference: USEPA Toxicological Review of Chlordane, In Support of Summary Information on the Integrated Risk Information System (IRIS), December 1997.)

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.

Project Number: 277710568.0008.06

Lab Number: L2005778
Report Date: 02/21/20

Data Qualifiers

- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

Methodology Review

Project Name: AMTRAK-EAST BARRACKS
Project Number: 277710568.0008.06

Lab Number: L2005946
Report Date: 02/18/20

REFERENCES

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Laboratory Chronicle

Sample Receipt and Container Information

Were project specific reporting limits specified?

YES

Cooler Information

Cooler **Custody Seal**
 A Absent

Lab Number: L2005946
Report Date: 02/18/20

**NJ DEP Data of Known Quality Protocols
Conformance/Non-Conformance
Summary Questionnaire**

1	For each analytical method referenced in this laboratory report package, were all specified QA/QC performance criteria followed, including the requirement to explain any criteria falling outside of acceptable guidelines, as specified in the NJDEP Data of Known Quality performance standards?	YES
1a	Were the method specified handling, preservation, and holding time requirements met?	YES
1b	EPH Method: Was the EPH Method conducted without significant modifications (see Section 11.3 of respective DKQ methods)?	N/A
2	Were all samples received by the laboratory in a condition consistent with that described on the associated chain-of-custody document(s)?	YES
3	Were all samples received at an appropriate temperature ($4 \pm 2^{\circ} \text{C}$)?	YES
4	Were all QA/QC performance criteria specified in the NJDEP DKQP standards achieved?	NO
5a	Were reporting limits specified or referenced on the chain-of-custody or communicated to the laboratory prior to sample receipt?	YES
5b	Were these reporting limits met?	NO
6	For each analytical method referenced in this laboratory report package, were results reported for all constituents identified in the method-specific analyte lists presented in the DKQP documents and/or site-specific QAPP?	YES
7	Are project-specific matrix spikes and/or laboratory duplicates included in this data set?	NO

Note: For all questions to which the response was "No" (with the exception of question #7), additional information must be provided in an attached narrative. If the answer to question #1, #1a or #1b is "No", the data package does not meet the requirements for "Data of Known Quality".

Conformance/Non-Conformance Summary

Project Name: AMTRAK-EAST BARRACKS
Project Number: 277710568.0008.06

Lab Number: L2005946
Report Date: 02/18/20

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Project Number: 277710568.0008.06

Lab Number: L2005946
Report Date: 02/18/20

Case Narrative (continued)

Report Submission

February 18, 2020: This final report includes the results of all requested analyses.

February 17, 2020: This is a preliminary report.

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

DKQP Related Narratives

PCBs

In reference to question 5b:

L2005946-11, -13, -14, and -15: One or more of the target analytes did not achieve the requested regulatory limits.

In reference to question 4:

L2005946-11, -13, -14, and -15: The surrogate recoveries are below the acceptance criteria for 2,4,5,6-tetrachloro-m-xylene (0%) and decachlorobiphenyl (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis are reported.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Authorized Signature: *Melissa Sturgis*

Title: Technical Director/Representative

Glossary

GLOSSARY

Acronyms

DL	- Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EMPC	- Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LOD	- Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
LOQ	- Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.) Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TEF	- Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.
TEQ	- Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

Report Format: DU Report with 'J' Qualifiers

Project Name: AMTRAK-EAST BARRACKS
Project Number: 277710568.0008.06

Lab Number: L2005946
Report Date: 02/18/20

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PAH Total: With respect to Alkylated PAH analyses, the 'PAHs, Total' result is defined as the summation of results for all or a subset of the following compounds: Naphthalene, C1-C4 Naphthalenes, 2-Methylnaphthalene, 1-Methylnaphthalene, Biphenyl, Acenaphthylene, Acenaphthene, Fluorene, C1-C3 Fluorenes, Phenanthrene, C1-C4 Phenanthrenes/Anthracenes, Anthracene, Fluoranthene, Pyrene, C1-C4 Fluoranthenes/Pyrenes, Benz(a)anthracene, Chrysene, C1-C4 Chrysenes, Benzo(b)fluoranthene, Benzo(j)+(k)fluoranthene, Benzo(e)pyrene, Benzo(a)pyrene, Perylene, Indeno(1,2,3-cd)pyrene, Dibenz(ah)+(ac)anthracene, Benzo(g,h,i)perylene. If a 'Total' result is requested, the results of its individual components will also be reported.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. If a 'Total' result is requested, the results of its individual components will also be reported.

The target compound Chlordane (CAS No. 57-74-9) is reported for GC ECD analyses. Per EPA, this compound "refers to a mixture of chlordane isomers, other chlorinated hydrocarbons and numerous other components." (Reference: USEPA Toxicological Review of Chlordane, In Support of Summary Information on the Integrated Risk Information System (IRIS), December 1997.)

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.

Data Qualifiers

- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

Instrument : Pest 19
Quant Date : 2/16/2020 2:45 pm

Compound #63: 1260-4 #2

Original Peak Response = 17547640

Manual Peak Response = 174108071 M3

M3 = Misidentification of the peak (i.e. 1,4-dichlorobenzene identified as 1,3-dichlorobenzene), or misidentification from 2 partially resolved peaks not being split.

Sample : L2005946-11d,42e,20, Quant Date : 2/16/2020 1:08 pm

Compound #10: 1260-2

Original Peak Response = 7077590

Manual Peak Response = 56141622 M3

M3 = Misidentification of the peak (i.e. 1,4-dichlorobenzene identified as 1,3-dichlorobenzene), or misidentification from 2 partially resolved peaks not being split.

Manual Integration Report

Sample : L2005946-12d,42e,5, Quant Date : 2/16/2020 1:08 pm

Compound #10: 1260-2

Original Peak Response = 8609405

Manual Peak Response = 69191407 M3

M3 = Misidentification of the peak (i.e. 1,4-dichlorobenzene identified as 1,3-dichlorobenzene), or misidentification from 2 partially resolved peaks not being split.

Manual Integration Report

Sample : L2005946-14d,42e,500, Quant Date : 2/16/2020 1:08 pm

Compound #63: 1260-4 #2

Original Peak Response = 2427098

Manual Peak Response = 23998652 M3

M3 = Misidentification of the peak (i.e. 1,4-dichlorobenzene identified as 1,3-dichlorobenzene), or misidentification from 2 partially resolved peaks not being split.

Manual Integration Report

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

NJ DEP
Data of Known Quality Protocols
Conformance/Non-Conformance
Summary Questionnaire

**NJ DEP Data of Known Quality Protocols
 Conformance/Non-Conformance
 Summary Questionnaire**

1	For each analytical method referenced in this laboratory report package, were all specified QA/QC performance criteria followed, including the requirement to explain any criteria falling outside of acceptable guidelines, as specified in the NJDEP Data of Known Quality performance standards?	YES
1a	Were the method specified handling, preservation, and holding time requirements met?	YES
1b	EPH Method: Was the EPH Method conducted without significant modifications (see Section 11.3 of respective DKQ methods)?	N/A
2	Were all samples received by the laboratory in a condition consistent with that described on the associated chain-of-custody document(s)?	YES
3	Were all samples received at an appropriate temperature ($4 \pm 2^{\circ} \text{C}$)?	YES
4	Were all QA/QC performance criteria specified in the NJDEP DKQP standards achieved?	YES
5a	Were reporting limits specified or referenced on the chain-of-custody or communicated to the laboratory prior to sample receipt?	YES
5b	Were these reporting limits met?	YES
6	For each analytical method referenced in this laboratory report package, were results reported for all constituents identified in the method-specific analyte lists presented in the DKQP documents and/or site-specific QAPP?	YES
7	Are project-specific matrix spikes and/or laboratory duplicates included in this data set?	NO

Note: For all questions to which the response was "No" (with the exception of question #7), additional information must be provided in an attached narrative. If the answer to question #1, #1a or #1b is "No", the data package does not meet the requirements for "Data of Known Quality".

Conformance/Non-Conformance Summary

Report Date: 02/18/20

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Report Date: 02/18/20

Case Narrative (continued)

Report Submission

February 18, 2020: This final report includes the results of all requested analyses.

February 18, 2020: This is a preliminary report.

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

DKQP Related Narratives

Sample Receipt

L2006151-14: The collection date and time on the chain of custody was 11-FEB-20 13:46; however, the collection date and time on the container label was 11-FEB-20 13:49. At the client's request, the collection date and time is reported as 11-FEB-20 13:46.

L2006151-16: The sample identified as "X-4_02112020" on the chain of custody was identified as "X-3_02112020" on the container label. At the client's request, the sample is reported as "X-4_02112020".

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Title: Technical Director/Representative

Glossary

GLOSSARY

Acronyms

DL	- Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EMPC	- Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LOD	- Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
LOQ	- Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.) Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TEF	- Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.
TEQ	- Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

Report Format: DU Report with 'J' Qualifiers

Project Name: AMTRAK-EAST BARRACKS
Project Number: 277710568.0008.06

Lab Number: L2006151
Report Date: 02/18/20

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PAH Total: With respect to Alkylated PAH analyses, the 'PAHs, Total' result is defined as the summation of results for all or a subset of the following compounds: Naphthalene, C1-C4 Naphthalenes, 2-Methylnaphthalene, 1-Methylnaphthalene, Biphenyl, Acenaphthylene, Acenaphthene, Fluorene, C1-C3 Fluorenes, Phenanthrene, C1-C4 Phenanthrenes/Anthracenes, Anthracene, Fluoranthene, Pyrene, C1-C4 Fluoranthenes/Pyrenes, Benz(a)anthracene, Chrysene, C1-C4 Chrysenes, Benzo(b)fluoranthene, Benzo(j)+(k)fluoranthene, Benzo(e)pyrene, Benzo(a)pyrene, Perylene, Indeno(1,2,3-cd)pyrene, Dibenz(ah)+(ac)anthracene, Benzo(g,h,i)perylene. If a 'Total' result is requested, the results of its individual components will also be reported.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. If a 'Total' result is requested, the results of its individual components will also be reported.

The target compound Chlordane (CAS No. 57-74-9) is reported for GC ECD analyses. Per EPA, this compound "refers to a mixture of chlordane isomers, other chlorinated hydrocarbons and numerous other components." (Reference: USEPA Toxicological Review of Chlordane, In Support of Summary Information on the Integrated Risk Information System (IRIS), December 1997.)

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.

Report Format: DU Report with 'J' Qualifiers

Project Number: 277710568.0008.06

Lab Number: L2006151
Report Date: 02/18/20

Data Qualifiers

- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

Quant Date : 2/17/2020 5:35 pm

Compound #64: 1260-5 #2

Original Peak Response = 5997258

Manual Peak Response = 3671656 M4

M4 = Poor automated baseline construction.

Compound #54: Decachlorobiphenyl #2

Original Peak Response = 214247

Manual Peak Response = 54781988 M2

M2 = Peak not found by automatic integration algorithm.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Lab Number: L2006460
Report Date: 02/26/20

**NJ DEP Data of Known Quality Protocols
Conformance/Non-Conformance
Summary Questionnaire**

1	For each analytical method referenced in this laboratory report package, were all specified QA/QC performance criteria followed, including the requirement to explain any criteria falling outside of acceptable guidelines, as specified in the NJDEP Data of Known Quality performance standards?	YES
1a	Were the method specified handling, preservation, and holding time requirements met?	YES
1b	EPH Method: Was the EPH Method conducted without significant modifications (see Section 11.3 of respective DKQ methods)?	N/A
2	Were all samples received by the laboratory in a condition consistent with that described on the associated chain-of-custody document(s)?	YES
3	Were all samples received at an appropriate temperature ($4 \pm 2^\circ \text{C}$)?	YES
4	Were all QA/QC performance criteria specified in the NJDEP DKQP standards achieved?	NO
5a	Were reporting limits specified or referenced on the chain-of-custody or communicated to the laboratory prior to sample receipt?	YES
5b	Were these reporting limits met?	NO
6	For each analytical method referenced in this laboratory report package, were results reported for all constituents identified in the method-specific analyte lists presented in the DKQP documents and/or site-specific QAPP?	YES
7	Are project-specific matrix spikes and/or laboratory duplicates included in this data set?	YES

Note: For all questions to which the response was "No" (with the exception of question #7), additional information must be provided in an attached narrative. If the answer to question #1, #1a or #1b is "No", the data package does not meet the requirements for "Data of Known Quality".

Conformance/Non-Conformance Summary

Project Name: AMTRAK-EAST BARRACKS
Project Number: 277710568.0008.06

Lab Number: L2006460
Report Date: 02/26/20

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Project Name: AMTRAK-EAST BARRACKS
Project Number: 277710568.0008.06

Lab Number: L2006460
Report Date: 02/26/20

Case Narrative (continued)

Report Submission

February 26, 2020: This final report includes the results of the PCBs analysis performed on L2006460-03.

February 19, 2020: This is a preliminary report.

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

DKQP Related Narratives

PCBs

WG1340879: An MS was not analyzed because the dilution required by the elevated concentrations of non-target compounds present in the native sample would have caused the spike compounds to be diluted below the range of calibration.

In reference to question 5b:

L2006460-01, -02, and -15: One or more of the target analytes did not achieve the requested regulatory limits.

In reference to question 4:

L2006460-01, -15, and WG1340879-5: The surrogate recoveries are below the acceptance criteria for 2,4,5,6-tetrachloro-m-xylene (0%) and decachlorobiphenyl (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis are reported.

L2006460-04, -07, -16, and -22: One or more surrogates failed to meet the DKQP recovery limits. Please refer to the sample results and/or QC section of the report for specific details.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Title: Technical Director/Representative

Glossary

GLOSSARY

Acronyms

DL	- Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EMPC	- Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LOD	- Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
LOQ	- Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.) Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TEF	- Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.
TEQ	- Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

Report Format: DU Report with 'J' Qualifiers

Project Name: AMTRAK-EAST BARRACKS
Project Number: 277710568.0008.06

Lab Number: L2006460
Report Date: 02/26/20

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PAH Total: With respect to Alkylated PAH analyses, the 'PAHs, Total' result is defined as the summation of results for all or a subset of the following compounds: Naphthalene, C1-C4 Naphthalenes, 2-Methylnaphthalene, 1-Methylnaphthalene, Biphenyl, Acenaphthylene, Acenaphthene, Fluorene, C1-C3 Fluorenes, Phenanthrene, C1-C4 Phenanthrenes/Anthracenes, Anthracene, Fluoranthene, Pyrene, C1-C4 Fluoranthenes/Pyrenes, Benz(a)anthracene, Chrysene, C1-C4 Chrysenes, Benzo(b)fluoranthene, Benzo(j)+(k)fluoranthene, Benzo(e)pyrene, Benzo(a)pyrene, Perylene, Indeno(1,2,3-cd)pyrene, Dibenz(ah)+(ac)anthracene, Benzo(g,h,i)perylene. If a 'Total' result is requested, the results of its individual components will also be reported.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. If a 'Total' result is requested, the results of its individual components will also be reported.

The target compound Chlordane (CAS No. 57-74-9) is reported for GC ECD analyses. Per EPA, this compound "refers to a mixture of chlordane isomers, other chlorinated hydrocarbons and numerous other components." (Reference: USEPA Toxicological Review of Chlordane, In Support of Summary Information on the Integrated Risk Information System (IRIS), December 1997.)

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedances are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.

Project Name: AMTRAK-EAST BARRACKS
Project Number: 277710568.0008.06

Lab Number: L2006460
Report Date: 02/26/20

Data Qualifiers

- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.
